SUICIDE BY BLOWS AGAINST THE HEAD. A Medico-Legal Study.

BY ALLEN STAPLES, A.B., M.D.,

OF DUBUQUE, IOWA.

Although suicide, accomplished by blows against the head of such severity as to wound the contents of the cranium, is of very rare occurrence, it has been observed in a certain number of cases. Such selfmurder requires more than ordinary energy, or insensibility to pain, for its execution, and these conditions chiefly obtain among the insane. There are recorded in medical literature a few instances in which the object was attained by blows on the head with a hammer or hatchet, or by driving within the skull a chisel or similar instrument. Certain of these cases, too, consist of persons who have tried to end their existence by other methods, less revolting, and have failed. Death from the self-inflicted wounds, or secondarily from the inflammation consequent upon them, as a rule, has been the final result. In the following paper 1 purpose to give as complete a series as I can, of cases illustrative of the remarks above, and to narrate more in extenso the history of a patient that came under my own observation.

The first case to be related is that of Dr. L. Langer.1 A poacher, 37 years old, attempted suicide by beating his head with a sharp angle of an ax. There passed other substances into his brain. Later he were found on the forehead, between the frontal eminences and extending into the hair, three wounds filled with crushed and splintered bone. The middle one was about two inches long, and showed at its bottom a half-inch fissure in the bone. There was also a Y-shaped wound above and behind the right ear, extending to the bone, a similar one just above, and a large swelling just below the occipital protuberance. The man recovered in two months.

Fourmet² relates a noteworthy case: A joiner had driven an iron chisel 3½ inches long and 3 lines broad up to its head by means of repeated blows from a hammer, into his cranium about the middle line. The patient became comatose, but, on the removal of the chisel in about seven hours, recovered within two

I. M., convicted of repeated arson and sentenced to

imprisonment for life, was reported to have simulated epilepsy and insanity, and to have made suicidal attempts by inflicting superficial wounds on his neck and arms. In October, 1859, he drove two nails, 11/2 inches long, into his frontal bone: these were with difficulty extracted by the forceps. In April, 1860, a similar attempt was made in the left pariet d bone. He quickly recovered from the effects of each attempt. In September, 1860, he introduced under the skull a piece of wire. Signs of brain irritation followed this last wound, and a week later death ensued. The autopsy showed the dura firmly united to the skull at the place of the last injury, and the perforations through which the nails had been driven closed by membrane. There was purulent meningitis that had been caused by four needles that were found sticking into the meninges and brain. These needles had been introduced through the openings made by the nails.

A case presenting much analogy to the above is narrated by Dr. V. Biart. 1 It was that of a convict in the Kansas State Penitentiary, who attracted much attention among his fellow-convicts by boring a hole in his skull with an awl, and introducing therein pieces of wire. The physician-in-charge removed several pieces that had pierced both cerebral hemispheres. The wound of entrance was situated in the right parietal bone, near its posterior inferior angle. The patient stated at the time that he had committed suicide by taking morphia; and at the autopsy his brain was found congested, and a wire three inches long and three-sixteenths of an inch thick was found running from the wound of entrance to the fissure of Sylvius. A flat nail one and threefifths inches long was also found lying near the wire.

Carpenteis relates a similar case of an insane patient who sought in the following ways to take his life: First, he bored through his skull just above the right ear, and passed a heavy wire four and threequarters inches into the brain. Second, he thrust an awl into the vertex. Third, through the first opening he pushed another wire to the opposite side of the skull, causing a left-sided hemiplegia that lasted fourteen days. Finally, after some months, he poisoned himself with morphia. At the autopsy a piece of A remarkable case was published by Angenstein.3 wire two inches long and a threaded needle were found lying near each other in the middle lobe of the

signs of mental aberration.

R. Frank'sⁿ case: This remarkable case, together with the result of the judicial investigation into it, I together upon a comparatively small surface, and will relate more fully, as the history is of much interest from a medico-legal point of view:

ordered. It was elicited that the woman lived in hand of the patient. easy circumstances, but was somewhat peculiar and secretive in habit. Her family energetically scouted head is a rare event, yet one sometimes observed; the idea of suicide, and the wounds were explained and experience teaches that this extraordinary mode by a fall from a chair or table while she was dusting of self-murder is chosen chiefly by the insane; it is pictures.

An examination revealed the following injuries: Hair in the anterior parietal and frontal regions abraded; a wound with ragged edges, four inches that came under my own observation: long, extending from between the eyebrows upwards and purulent meningitis.

above case was as follows:

1. J. N. died of purulent meningitis.

2. This was caused by violence through the above forty feet, and walked thence with but little aid. named injuries, especially by that reaching from the base of the nose directly backwards, forking posteriorly, and producing the fissure on the frontal bone.

and sharply defined wounds of the scalp, coursing side of the head, at a point about one and five-eighth generally from before backwards, was caused by vig-linches above the meatus auditorius, and one inch in orous blows with a sharp and heavy instrument, prob. front of a line dropped from the vertex to the meatus. ably with a hatchet, and the number of blows must have been nine or ten. The straight fissure of the side, about one and one-quarter inches, at a point frontal bone, and the incisions at the posterior end, one inch above, and half an inch in front of, a verfrom the fact that between the cleft walls, large pieces tical line bisecting the meatus. The length of the of bone are wanting, and the walls of integument chisel was eight and one quarter inches, the diameter

on the arm. The patient had previously showed bounding the wounds can be recognized, must have been caused by two or more blows.

4. Since these numerous wounds were compacted easily accessible to the hand of the patient, and were in the same direction from before backwards In the Vienna Allgemeines Krankenhaus, Surgical, and almost parallel, and since some of them scarcely Section, a woman 64 years old presented herself on break the skin, therefore the suspicion is very strong the forenoon of September 28, 1884. Her statement that these injuries were produced, not by a foreign was, that her wounds were self-inflicted and made by hand, but by that of the patient herself, for the pura hatchet. In consequence of her injuries she died pose of suicide. This suspicion is confirmed by the on October 4. Except some mental hebetude, she circumstance that on the inner surface of both foredid not show any cerebral symptoms. But because arms, on the flexor surface of the left wrist and under of her mental dulness, her ante mortem assertion that both knees are, huddled together, numerous parallel her injuries were produced by her own hand was not superficial wounds that doubtless arose from an atdeemed trustworthy, and a judicial investigation was tempt to open the veins, and were produced by the

> A suicide caused by blows directed against the therefore to be justifiably suspected that this patient, while she was insane, accomplished the deed.

The last history of a case that I shall relate, is one

On December 16, 1885, Dr. G. M. Staples was and backwards, and forking above, was continued to called to see J. A. M., a short, thick-set German, the right an inch farther. This large wound had a about 45 years of age, of florid appearance, and stellate appearance, and at its widest portion was stone-cutter by trade. He saw M. about 10 A.M., two inches across. On the left side of it were two and found him sitting up in a saloon that adjoined smaller wounds, and on its right side were two oth his shop. The patient was semi-conscious, and had ers, incised and parallel, that penetrated the skull, the appearance of a man somewhat intoxicated. On Their walls were inflamed and purulent. Numerous inquiry, it was found that he had left the saloon about smaller wounds were found on the right forearm, el. 9 A.M., after drinking several glasses of beer. The bow, knee, and on the left knee. The frontal bone proprietor stated that he had appeared considerably showed a fissure two inches long, half an inch wide, depressed in spirits, but returned to his shop to work In addition, there were seven punctures that had as customary. Twenty minutes thereafter two genmore or less completely penetrated the skull. Be- tlemen attempted to enter his shop to consult him sides the above named lesions, on the inner surface about work, but found the door, which was partially of the calvarium were found blood clots with frag- glass, locked. Looking through the door, they disments of bone. The anterior portion of the right covered M. walking towards them with a long chisel upper frontal convolution showed degeneration, and protruding from his forehead; he stooped down and was dotted over with small kemorrhages. The rest-attempted to unlock the door, but after trying some of the brain was anæmic and soft, the ventricles con-minutes and appearing unable to turn the key, those tained a turbid fluid; there were clots in the sinuses from the outside forced the lock and entered. M. then said to them, "Drive the chisels further into my The expert opinion of Prof. Hofmann in the head," and then, shortly after, "For God's sake pull them out." The patient was immediately taken to the saloon above spoken of, a distance of perhaps

Dr. G. M. Staples was summoned at once, and found on his arrival the following condition:

The head of a small stone chisel was found pro-3. This fissure, as well as the neighboring elongated truding about three lines from the scalp on the right

> The point of the chisel had emerged on the left of its head, three-eights of an inch, and it tapered to a flattened point. A similar chisel had been driven

²¹ Wiener, Med. Wochenschrift, Nos. 15, 16, 17, "Selbstmord durch Hiebe gegen den Kopf," von R. Frank

margin of the superciliary ridges, and had penetrated one and one quarter inches.

protruding point with a block of wood. The second had perforated the skull. chisel was bent to an angle of 20 degrees, five-eighths

rhythmical flexion and extension of the lower extrem-tions, that, from their peculiar situation and correities. At 1 P.M. his restlessness became much more spondence to the heads of the chisels, were supposed marked. He continually endeavored to arise in bed, to indicate the number of blows needed to accompand get upon the thoor, requiring two powerful men lish the deed described. This is easily explained by the quick monot be followed by any marked effect.

Such wounds as those in our case belong to the tention can be directed. punctured or perforating variety of wounds of the head; of this class there are but six reported in the History of the War of the Rebellion," and in no one duced. of these was there absolutely complete perforation. Five of these patients were wounded by a bayonet, one by a sword, one survived, permanently disabled, in other portions of the body. five died with extravasation of blood in one case, cess of the brain in two cases.

As to the treatment of our case there is little compatible with resistance. room for discussion. All surgeons will agree that The best authorities, too, are in favor of famous tamping iron case, says that it was due in the causes in one case each. great measure to the free outlets in the skull above and below, that the man Gage owed his life.

In wounds of the head where the skull is perforated case must be carefully considered. the mortality is always very high, no authority giving it as less than 80, and some giving it 100 per cent. "If death follows in twenty-four or thirty-six hours, it will be from shock and the extravasation of blood and serum, when the fatal result is longer delayed, encephalitis or abscess will ultimately prove fatal. When the projectile remains within the cranium, the danger is greater than when it passes through or perlate war show a difference of 5 per cent in favor of in the former being 80 per cent, and the latter 85.5 per cent."22

A study of the above cases shows that death often does not result from the immediate effect of the injuries, more often the patient either gets well of them, dies from the resulting inflammation, or tries some producers will not prove effective. other method of suicide. Another lesson to be drawn from these cases is, that even heavy blows removal of the diseased, hyperaesthetic mucous memagainst the head do not necessarily produce con- brane that covers the turbinated processes and porcussion of the brain.

The Galvano-Cautery.—Every one has a favorite manner of applying the galvano-cautery. Some alsyringe and transfixed the growth and then placed low the platinum to become almost white hot before passing it into the nasal cavity. I did this on several occasions, to my patient's detriment, the radiating heat being so great as to cause acute inflammation of the whole cavity and great swelling of the face. This led to the idea of having the needles so at. The electrical energy should be sufficient to make tached to the ecraseur, that they could be used after platinum white-hot in one second of time while held the loop of wire was placed around the growth, in the air. Of course if the current was allowed to Figure 2, illustrates the instrument I have had made continue, the wire would be burnt through in about three or four seconds, but when the electrode is laid In some instances I find that this snare, as modified on the tissue, this keeps the wire from becoming

I prefer to place the electrode on the spot to be with his needles in the place of this instrument. The cauterized and then make the connection with my foot, never using my finger or thumb for making the 1. April 29. Very little headache all day, slight during the night, and pain confined now to the left side of head.

May 1. Slight headache on left side. Slept well, discarded supporting pillows. Left eye epiphora. Temperature and pulse normal.

May 14. Out of bed. Diplopia produced only

when the eye is turned far to the right side.

June 1. Eyes normal. Hearing on the left side normal; right ear, hearing $\frac{2}{3}\frac{6}{6}$. The points of interest attached to this case may be classified as follows:

- 1. Constant poulticing in this form of disease is reprehensible practice, and fraught with destructive changes. The patient, contrary to the physician's instructions, applied a spray of warm water, hours at a time. The natural result was a maceration and breaking down of the tissues, accompanied by intense engorgement of the vesssls and infiltration of the surrounding parts. Granulations and consequent suppuration completed the picture of a most intense acute inflammation. All forms of continuous poulticing must be carefully avoided unless it is desired to favor suppuration.
- 2. The invasion of the cranial cavity is not at all a frequent accompaniment of otitis media purulenta acuta, neither is its termination usually as favorable as in the recorded case. We know that the osseous partition between tympanum and cranial cavity is extremely thin, and in some instances natural fissures exist in the tympanic roof, covered only by the mucous membrane. This naturally favors the progress of the disease by direct continuity of tissue and involvement of the meninges. In chronic forms of the inflammation these complications arise only after the bony barrier has been broken down by the protracted process of caries and necrosis.
 - 3. The relief obtained by the application of ice bags

all probability through a dehiscence in the tegmen to the mastoid was immediate, and substituted the orditympani. Pressure on the abducens nerve by exud- nary method of applying fomentations. Last spring ative material would account for the strabismus. A CASE OF PSEUDO-MEMBRANOUS LARYNGITIS TREATED BY ELECTROLYSIS.3

BY F. E. WAXHAM, M.D.,

PROFESSOR OF DISEASES OF CHILDREN, COLLEGE OF PHYSICIANS AND SURGEONS, OF CHICAGO,

Almost every organ of the human body, when in a diseased condition, has been subjected to the influence of electricity. The urethra, the prostate, the ovaries, the uterus, the brain, the liver, and the spleen, have all been treated by this silent, strange and powerful agent. Until recently, however, the larynx has not been invaded. If it be true that strictures of the urethra can be cured by the galvanic current; if it be true that enlarged prostates can be reduced, and fibroids of the uterus successfully treated, it has occurred to me that stenosis of the larynx from membranous exudation might be reduced in the same manner. If false membrane can be destroyed or detached in this manner, it will be a great advance in the treatment of one of the most distressing, frightful and dangerous diseases of early life. The thought that this is a field worthy of investigation is the apology I make for this brief report.

On October 20 I was called to see Esther J., a little girl of eight years. The little patient had been sick nearly a week with membranous croup, and had been attended by Dr. E. C. Helm. The patient was also seen by Dr. Sanders. The child was in a most desperate condition, and all hope of recovery had been abandoned. The pulse was rapid and feeble. the face of a deadly pallor, the lips livid and the respiration laborious in the extreme. The child was in the last stages of asphyxia, already semi-comatose. and was roused with difficulty.

 $^{^{1}\,\}mathrm{Dr},\,\mathrm{H},\,\mathrm{A}$. Johnson kindly saw the case with me on two occasions during the absence of Dr. Doering.

It has been my practice for several years to use in-In cases of sexual perversion of one kind or another, halations of amyl nitrite in all amblyopia cases, and bromide is very useful. In young men and women, I have found it of great value, especially (if not exwith a tendency to commit suicide or be violent, a clusively) in the cases of tobacco amblyopia. I bedose of from 20 to 40 grains at bedtime has good lieve that it is of great assistance in differential diageffect. Any tendency to epilepsy is often treated by bromides, but here frequently the number of fits are reduced at the expense of harm to the mind. Bromide is generally given in combination with chloral, and the author's experience is that they do no good. In the sleeplessness of the early stage of puerperal insanity it is well to try them, and they may tide over a dangerous time; but if rest be obtained at the expense of appetite for food, more harm than good is done. Dr. Savage lays down the law: if sufficient food be taken, bromide or bromide and chloral may be pushed in cases of mental excitement. Objection is taken to chloral because it soon disturbs digestion; but in cases of acute delirious mania, if given with abundance of food and stimulants, it will save many from death.—London Medical Record, Nov. 15, 1886.

NATURAL HISTORY OF TUBERCULOSIS AND THE BACILLUS THEORY.—DR. R. B. JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No. 65 RANDOLPH STREET,

CHICAGO, ILLINOIS,

SATURDAY, JANUARY 1, 1887.

A COMPLETE ORGANIZATION OF THE MEDICAL PROFESSION, AND HOW TO ATTAIN IT.

"We want 80,000 doctors enrolled under one Constitution and By-laws believing that their common interests are faithfully looked after by the great central body. Perhaps such a hope is Utopian. But we are sanguine enough to believe that it can be wrought out, and must be if the American profession shall attain the power to which it is entitled."—American Lancet, p. 422, for November, 1886.

able contemporary simply expresses the desire to not even a general registration of the members of have the entire number of members of the regular the profession in many of the States, the prospect of enrolled under one general organization, and a de- ganization capable of wielding an united influence, is lished. The idea of such an enrollment or nominal impracticable to bring the whole profession of our one organization can never be effected or perpetu-, ance with a uniform ratio of their membership, thus

ated either in Great Britain or the United States of one, and an equally imperative law of Congress for the other, enforced by adequate penalties. The probability of the procurement of such a National law susceptible of practical enforcement, in either country, is too remote to justify its further consideration at present. The development of such a complete organization or literal enrollment under one Constitution, by the voluntary act of the entire membership of the profession, if even attained, would require at least one or two centuries if we may judge by the progress made in the past.

Great Britain, from the comparatively limited extent of her territory and the density of her population, presented conditions much more favorable for the success of such a plan, than our own country. Notwithstanding, the British Medical Association organized with a limited and stable Council for the management of its business affairs, and rules favorable for the formation of Branches in all parts of the country, the members of which thereby become members of Association, has been in existence fiftyfour years, and has enrolled as members to this date only about one-half of the members of the profession in England and Wales, Scotland and Ireland, who are legally authorized to practice medicine, surgery and midwifery. With our vast territory divided into between thirty and forty States with no uniform laws The above paragraph from an editorial in our valu- regulating either medical education or practice, and profession of medicine in the United States actually bringing them all into actual membership of one orgree of confidence that it can be practically accompacertainly very remote. While it may be justly deemed membership of the whole profession under one country into actual voluntary membership of one Constitution and By-laws, to be governed by a com- organization under one constitution, it certainly is paratively small select Council or Senate, is not new, not impracticable to so far complete the organization but was the fundamental idea or principle on which of the profession into municipal, country, district, the British Medical Association was founded more State and National Associations, on the representathan half a century since; the same that shaped the tive basis, as to give it all the unity and power, with organization of the Massachusetts State Medical So- far greater facility of expression, that has ever yet ciety with its Branch or District Societies; and the been attained by other methods. A complete organisame was actively discussed by the Committee ap-zation of the profession on this basis would require pointed in 1846, to report a "Plan of Organization the voluntary formation of the regularly educated for the American Medical Association." We are members of the profession in each county of each State; satisfied that our confrère of the American Lancet each State Society should be composed essentially . and all others who will thoroughly study the history of delegates elected anually by the County Societies and practical results of Medical Society Organiza- in accordance with a uniform ratio of representation; tions among all English speaking people, will become and the National Association should consist of deleconvinced that such a complete enrollment under gates appointed by the State Societies, also in accordhabits of thought of our people.

FERMENTATION, PUTREFACTION, AND SUPPURATION.

combining the whole profession in one National sufficiently appreciated in this country. He quoted representative body, based directly on the State a recent opinion of Professor Brieger, of Berlin, to Medical Societies, and indirectly through them, on the effect that the great majority of all diseases now the municipal and county societies of all the States, seem to be of bacterial origin, and in support of the in strict accordance with the political institutions of correctness of this proposition referred to the weekly our country, and in harmony with the prevailing mortality lists of the various American cities. Thus, during the week ending August 28, 1886, the number The organization of the American Medical As- of deaths from infectious diseases in New York was sociation commenced in 1846 and completed in 1847, set down at 33 per cent. of the total mortality; those was based essentially on this principle of representa- from consumption at 16 per cent.; and those from ited number of county and State Societies then in exist-were nearly 55 per cent. of all deaths attributable to ence and the diverse organization of such as did ex-diseases of undoubtedly bacterial origin. In addiist. But the adoption of the fundamental principle tion, 20 per cent, of the deaths were from diarrheal by which the responsible roting membership of the diseases, and at least 90 per cent., if not all of them, delegates from local and State societies gave so much brings the percentage up to 75 per cent. But such impetus to the work of organization of these, that affections as pneumonia, peritonitis, syphilis, gonorfor several years past regular organizations have ex-rhee and skin diseases, are not included in the estiisted, and have been sending delegates to the National mate; and if only to per cent, of these were classed Association in every State, in many of the counties, as of this character, it would increase the present and all the larger cities of our country. A full in- percentage to 85. This is exclusive of surgical disvestigation will show that during the forty years since eases in which undue suppuration is caused by mithe organization of the American Medical Associa- crobes; and estimating the mortality from these at 5 tion it has increased its direct constituency in the per cent., we have a grand total of 90 per cent. of local, County, District, and State Medical Societies, all deaths to be attributed to disease of bacterial orito an aggregate number three times greater than are gin. It seems, then, that Professor Brieger is right.

Bacteriology has shown its principal fruit in the Medical Association resulting from the fifty-four years' department of surgery, and there can be no sort of doubt that antisepsis has advanced this branch of ical body. During the past history of the American medical science to its present high position. Anti-Medical Association such improvements have been sepsis, however, is in reality nothing but the practical made from time to time, in the practical application application of the three words, fermentation, putrefaction, suppuration. Fermentation may be described has shown to be necessary, leaving, at present, but as the decomposition of carbohydrates through the few further changes of importance desirable. But agency of the yeast-plant; and we may compare the action of the latter to that of the bacteria which are trict where no society yet exists, and the making of There are two grades of putrefaction (which is those already in existence more full and efficient, brought about by different kinds of microbes, fifteen tance we will give attention in another number of cred); the first grade is met with when there is but little oxygen present; the products being water, carbonic acid and ammonia, and the process of decomposition is attended with little or no offensive odor. The second grade, or putrefaction proper, as generally understood, is seen when there is a larger quan-Notwithstanding the deluge of matter that has been tity of oxygen present. Dr. Knapp then discusses published of late years in regard to bacteriology, Dr., the question, whether suppuration and putrefaction HERMANN KNAPP, in introducing a recent lecture on are one and the same thing. Surgeons, he said, use "Fermentation, Putrefaction and Suppuration" before the two terms indifferently, and after speaking of the the New York. one to two. In some of the animals operated on the injection was made through the sclerotic. When the same chemical agent (either croton oil or turpentine) was introduced into the other eye in connection with pyogenic fungi, the most violent suppurative inflammation was always produced. He has also made a large number of cultures from the two classes of eyes. From the eves containing pus, an increased quantity of microbes, with pus, resulted. But microbes (although no pus) were also obtained from the eyes from which pyogenic fungi were excluded; and this is of the experiments of a large number of clinicians. a point that calls for an explanation. The microbes were found not only in the eyes, but also in the kidnevs and the blood, though not in the brain. It is evident, therefore, that the system had become infected through the suppurating eye; and the microbes found in the other eye no doubt originated from this source. He therefore made the two classes of experiments in two different series of animals, instead of operating on both the eyes of the same rabbit. When the cultures were now made, no microbes were found to have come from the non-suppurating eyes. These experiments seem to be satisfactory and conchisive. In the eyes into which pyogenic germs were introduced in connection with the chemical agent, subject any special study, but the subject of tempersuppuration occurred and microbes were found in large numbers; but in the eyes from which such germs were excluded there were neither suppuration nor microbes. The results observed in the latter were merely coagulated fibrin and fibrino-leucocytic creased or diminished and radiation remains normal, exudation. He thinks, therefore, that so far as this whole series of experiments go, we are justified in formulating the proposition that suppuration is always produced by microbes; and hence there can be no bific agents.

What, then, is suppuration? First, as in the case of fermentation, the microbe ought to enter into its definition. Fermentation, as has been seen, is the splitting up of a hydro-carbon into simpler forms through the agency of the yeast plant. Putrefaction, again, is the similar decomposition of a nitrogenous substance through the agency of microbes. Finally, suppuration is likewise the splitting up of a nitrogenous substance, by the same kind of agents. The difference between the two is that in putrefaction, the process is always concerned with dead matter, while suppuration always takes place in living matter.

Physicians of Philadelphia.—Full preparations have been made for an interesting and elegant celebration of the Centennial Anniversary of this wellknown Society, January 3d and 4th, in Philadelphia, er value to us than the thermometer.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, Monday, December 6, 1886. THE PRESIDENT, EDMUND J. DOERING, M.D., in the Chair.

Dr. John A. Robison read a paper on the ANTIPVRETIC ACTIONS OF ANTIPVRIN AND THALLIN, in which he had collected and condensed the results The largest number of observers agree that antipyrin is a safe, efficient and unobjectionable antipyretic. Contrary to belief in general it does not have a depressing or debilitating effect on the heart, whereas thallin has. Antipyrin causes no change in the blood, whereas thallin has a deleterious effect on the blood and veins. In conclusion, the author believed antipyrin should always be given to produce a pyrexia in cases where the temperature is excessively high. He does not believe the drug has any influence to lessen or prolong the duration of the continued fevers. He also stated that it not only lowers the temperature, but relieves the pain that accompanies acute articular rheumatism with endocarditis, especially if given with alkalies.

DR. J. J. M. Angear said: I have not given this ature I have, and it may not be amiss to speak of some difficulties which we have to contend against. If radiation is increased or diminished and metabolism remains normal, we have increased or decreased temperature; or if metabolism of the body be inthen we have increased or decreased temperature. We have no means of arriving at any definite conclusion whether our patient, with increased temperature, is suffering with increased metabolism or decreased radiation, or both. We know from observation and suppuration without the intervention of these mor- from various experiments that the internal part of the body is very frequently hotter than normal during the cold stage of fever, and cooler than normal during the febrile stage. May not the sum total of caloric in the body be diminished when the thermometer tells us that it is increased, and vice versa! If we answer yes, then we are found trying to diminish the temperature, when we should be husbanding what we have. Does not this show that there is a certain amount of pathological knowledge in regard to body temperature which we have not yet arrived at? And our therapeutical knowledge is necessarily as defective in this regard.

Do antipyretics facilitate radiation or check metabolism, or both, or do we know anything about it except its action upon the thermometer? could arrive at some definite, pathological conclu-CENTENNIAL CELEBRATION OF THE COLLEGE OF sion as regards the pyrexial state of the patient, then we could, perhaps, arrive at some scientific knowledge of the action and use of all antipyretics. Had we an instrument by which to measure the amount of radiation and metabolism, it would be of far greatof scarlatina, two of lung trouble. In regard to the position. fever, I admit that the remedy had an antipyretic temperature, of course, but the same effect was pro-temperature. duced by quinine.

tice does not often enable me to watch the effects of typhoid fever, and none of the patients were older antipyretic drugs in disease, I can speak of the effect than twenty one. In these cases there was a visible of antipyrin in one disease, viz., the dentition fever decrease in temperature and the delirium was lessof infants; which, although not usually serious, is in ened very much. a great many instances annoying, and in which, when the fever is high, there is a possible danger of control give anything except the results of the observathe course of eight to twelve days.

He had used it in cases of typhoid pneumonia. One conclusion; these experiments have been carefully point is the favorable action of antipyrin on the head—conducted and we have seen that antipyrin actually aches of typhoid tever. One of the most distressing reduces high temperature without any danger to the symptoms when the temperature is very high is the patient, and it is only in cases where the high temsevere, continued headache and the delirium which perature itself is a danger to the patient that its use always accompanies it. He had not found any other in large doses is to be recommended. In regard to remedy that would have as good an effect in these, its use in aborting typhoid fever, I have not tried it cases as antipyrin, which always relieved the head-bexcept in four cases; one was a boy under sevenache promptly.

The child was weaned in December, 1885. About with water, are used. Twelve cells could hardly be March 17, 1886, she experienced severe metrostaxis, entirely without pain, and lasting six days. She supposed menstruation had been reëstablished and gave the subject no further thought. About April 15 another severe hæmorrhage occurred, painless and lasting one week. On May 28 she came under the writer's observation, and was admitted into the wards of Mercy Hospital. She sought relief, as she very distinctly expressed it, on account of painful coitus, the sensation of the presence of a foreign body within the vagina, and the excessive loss of blood during her last two menstrual periods. The woman was of medium size and height, with well developed muscles and clavicles like a man's. She presented evidence of marked anæmia.

Diagnosis.—Bimanual palpation revealed a pyriform tumor, the size of a hen's egg, protruding through the os uteri. The base of the tumor rested upon the pelvic floor, and upon coughing or straining appeared at the genital fissure. A shallow sulcus the cervical canal, extending around the left semiger and traced with the sound. On the right side, abdomen in bimanual palpation.

abdomen in the attempt to roll out the parts forming ter was accordingly withdrawn. the ring, by sliding the abdominal parietes over its with no more favorable result.

Emmet's method was then abandoned for the fol-plete and as irreducible as the day on which the of prolonged anæsthesia.

With reference to these which he mentions—in other words, that they are cases Dr Dieulafoy dwelt on the fact that there is composed of physicians who are not well educated, no strict correlation between albuminuria and Bright's not experienced in the detection of pathological condisease. There are some symptoms, however, which ditions, not of good judgment, honest, and independwill enable us to recognize the renal lesion. These ent, etc. Now, upon all these points, I take direct consist chiefly in the troubles of the urinary secre- issue with Dr. Conner, and express the belief that tion, and above all pollakiuria, or necessity of fre- he cannot make good any of the propositions which quent micturition during the night, cephalalgia, op he advances. From a personal knowledge of the pression, occular disturbances, auditory troubles make-up of several Boards of Pension Examiners, (deafness, rumbling), the sensation of "doight morts," the writer believes that they are composed of a class or numbness in the fingers, which latter the author of physicians who, as a rule, will not in the least sufconsiders pathognomonic. He referred also to Pro- fer by comparison with a like number of the medical fessor Bouchard's test, according to which, the selfofficers of the Army, in all that relates to education, cretion of urine being a process of deputation, it may experience, and in the possession of the various qualbe conceived that if the kidneys work badly, the ifications necessary for thorough and impartial examurine which they excrete, not containing all the or- inations. The Pension Examining Boards are, in the dinary products of elimination, will be less poisonous main, composed of the best medical talent in the than normal urine, which fact has been verified by various cities and towns wherein the Boards are loexperiments on animals. For instance, while in the cated. A very considerable number of their memnormal state, 15 to 20 grammes of urine suffice to bers are men who have had a large experience as kill a rabbit, it would take 250 to 300 grammes of Army surgeons during the late war, and who have Brightic urine to produce the same effect. It is pre- made high reputations in long and successful profescisely this last circumstance which is found in Bright's sional careers. The Boards, as a rule, are thoroughly disease, and which, in certain exceptional cases can, equipped with all the various aids to diagnosis which the inventive genius of the profession is continually giving to the world.

The competitive examination, which Dr. Conner states is a requisite to membership in the Medical Corps of the Army, has by no means succeeded in placing that Corps upon so high a plane as our author would have us believe, for it is a well known fact that these examinations are not, never have been, and in the nature of things never can be, wholly freed from personal and political influences. It is body is doubtless composed, in the main, of men of cling expenses, the present cost to the Government not warranted by facts. It is, however, true, that truly, just as the "West Pointer" was, during the late war, disposed to arrogate unto himself all military knowledge, so was the regular army surgeon disposed to put on airs over the volunteer surgeon; but that this assumed superiority was groundless, the writer, as well as many others, had ample opportunity for observing. In field, or in post hospital, no better work was done than by the volunteer surgeon.

But I have not yet mentioned all the beneficent results which Dr. Conner is confident would ensue, both to the Government and to the pensioner, should his plan be adopted. He says that, as a result of the adoption of his scheme, "deserving applicants would get what they deserve, and the ratings would be far more uniform than at present." To this I reply, that deserving applicants, as a rule, now get what they deserve, and in regard to the uniformity of ratings, what reason have we to doubt that as great a diversity of opinion would exist among the Army surgeons as now exists. Dr. Conner says further: "There would be no more complaints or charges that pensions were recommended or advised against because of the applicant's connection with this or that political party." To this we reply, that not many complaints of this nature have been made, and these, no doubt, for the most part groundless. Yet surely, the surgeons of the Army are members of some political party, and there is no earthly reason why they would not be just as susceptible to political influences as are the present examiners.

Dr. Conner also informs us that, under his plan, "the end results of excisions and of amputations might be determined, as they now cannot be." The italics, and exclamation point, are mine. Also, he says further: "The Government would be benefited, meritorious soldiers and sailors in some degree rewarded for privations, sickness, wounds," etc., but this is enough. He also states, and truly, that the establishment of such a board as he advocates was, at one time, strongly advocated by the authorities of discussion, the present system of pension examinaefficiency, by leading members of both houses of Congress, and of both political parties.

The plan proposed by Dr. Conner would give us one pension examiner where there are now about thirty, an average of about one Board to a State. Under this management, it is hardly necessary to

not the purpose of the writer to or little or to mis- Board of Examiners; while should the Government, represent the Memear corps of the Army. BOOK REVIEWS.

The Physician's Visiting List (Lindsay and Blakiston's) for 1887. Philadelphia: P. Blakiston, Son & Co. Chicago: W. T. Keener.

This "Visiting List" is now in its thirty-sixth year of publication, and is so well known to the profession that but little need be said of it. It is published in several sizes, for 25, 50, 75 and 100 patients weekly, at prices ranging from \$1.00 to \$3.00, the latter price being for large lists in two volumes (January to June, and July to December). A perpetual edition is also published, and an interleaved edition at a moderately increased price. It contains calendars for 1887 and 1888, Marshall Hall's "ready method in asphyxia," a table of poisons and antidotes, tables of the metric system, a dose table rewritten to accord with the sixth revision of the U.S. Pharmacopæia, a table of disinfectants, directions for the examination of urine, a table of standard reference books, table of incompatibles, a new table for computing the period of utero gestation, a list of new remedies for 1886-7, Sylvester's method for artificial respiration, and a diagram of the chest, besides the blank leaves for visiting list, monthly memoranda, addresses of patients, nurses and others, of accounts rendered, memoranda of wants, obstetric and vaccination engagements, record of births and deaths, and cash account.

MISCELLANEOUS.

Prof. Kolomnin's Scicide After a Faim Opthe Pension Bureau. He might have stated further, ERATION.—Professor Kolomnin, of St. Petersburg, that the measure failed, because the debate thereon recently committed suicide after the death of a pain Congress completely demonstrated the utter im-tient from cocaine. The patient, says the British practicability of the measure, and also during that Medical Journal, who was operated on was a young woman who had been sent from the medical out-pations was warmly endorsed for its thoroughness and tient department into the surgical wards. Professor Kolomnin found a large ulcer of the rectum, which he believed to be of a tuberculous nature; he decided to scrape and cauterize it. Proposing to employ cocaine as an anæsthetic, he made a number of inquiries as to the maximum dose, and looked up the literature of the subject, which comprised about thirty state that thousands of pensioners could not afford cases, in which from 6 to 90 grains (the Russian the time and money necessary to reach the Board, grain = 1.0417 grain English), had been employed. while under the present arrangement, few need to be Most of these cases were operations for crushing absent from home over night in order to reach some urinary calculi, and though the bladder, if healthy, is

Agair, Professor Dieulafoy had employed 48 grains 11, 1886. of cocaine in a rectal operation with success. Having regard to all these reported facts, Professor Kolomnin thought himself justified in disregarding the op nion of his colleague, the Professor of Pharmacology, who said he considered two grains a maximum dose. He, however, decided to give rather less than half the quantity used by the French professor, and to administer it in four rectal injections. After the third of these, it was found that anæsthesia had not been produced, so Professor Kolomnin inroduced a speculum, touched the surface of the ulcer with a dry sponge, and gave another injection, which produced an esthesia, though not of a very complete character. The ulcer was scraped, and an oiled plug left in contact with it. The pulse was then somewhat rapid. Forty-five minutes afterwards the pulse became greatly enfeebled, and the respiration labored, the face and hands assuming a livid appearance. Everything was tried without availfaradization, artificial respiration, subcutaneous ether injections, ammonia, stimulating and nutrient enemata, and even tracheotomy, with inhalation of oxygen death being evidently due to the toxic action of cocline. In some quarters Professor Kolomnin was much censured, but he himself considered that, with all the authority of numerous reported cases, he was not to blame for using the quantity of cocaine that he did. He, however, fancied that he had made an error in diagnosing he ulcer as of a tuberculous nature, and worried himself about having undertaken the operation. As to his own personal condition, he had lived for some years a most secluded life, devothad lived for some years a most secluded life, devoting himself entirely to his scientific wark, and making no intimate friends. He had latterly complained of palpitation and sleeplessness, and had become very irritable and, in some instances, forgetful, so that there is no doubt in his eminent colleague's mind that when he committed suicide he was not really aware of the gravity of what he was doing. The day before he had gone to Professor Botkin to ask him to give an address at a medical society for him, as he felt too unhinged to do it. This request was complied with, his own death serving, alas! as the subject.

Accordingent During Hypnotic Seefp. -In the Wiener Med. Wochenschrift a case is mentioned of a woman whom Dr. C. Brann succeeded in rendering unconscious during labor by throwing her into a condition of hypnotic sleep; the uterine contractions were particularly painful. They were equally violent during the period of unconsciousness, but the intervals were somewhat longer; dilatation of the pass-ages took place in the most satisfactory manner, and delivery was speculty accomplished. The observadelivery was speedly accomplished. The placentawas expelled into the vagina, and was easily withdrawn with the hand. On awakening, the patient did not complain of pain, and afterwards slept naturally for several hours. One of the most inter- Williams, L. L., Asst. Surgeon, upon expiration of leave, to esting features of the case was that the uterine con-

medical men, to say what ailed him, let me rapidly eating as it is), you need have no fear," etc. (After outline his eight years' record at St. Elizabeth, premising that this was only about one third of a career, as I do, and if he hadn't 'fallen by the wayside' we the ancients was by the ocean. In that period of he got time to exhibit his sobriety he got drunk," insane; the insanity was certified to by two physical this note, left Providence Hospital on last Saturday cians; and once he remained for a considerable time time "sobering up" in one of the city hospitals, the bed; and has been three times arrested. work-house, the alms-house, or the sheltering arms of some other electrosynary institution. It was during a stay in one of these havens of rest, already becoming restless for a drink, that he writes he had "now run the gauntlet of all the institutions (naming them) except a lying in establishment, of which he note books, but with my limited time a single epi-

Seeing how large a portion of these eight years appearance at the bar of the police court led Judge Snell to exclaim, "Col., are you always drunk?" To which, with the gravity of a pundit, the Col. replied,

There was a noticeable periodicity about the Col.'s us I find six of duration as follows: two of one month and seven days each; one of one month eight days; one of one month twelve days; one of one month eleven days; and one of one month four days. The two longest detentions, seven months and twelve From a moral standpoint the mental obliquity, not days, and four months and five days, respectively, were both after strenuous voluntary efforts for his by no means exceptional in the Col.; it is the key- own commitment, and were associated with a long preliminary training in police court and work-house. There were times when he was anxious to get into the hospital—and accomplished it against decided opposition—as at others he was as anxious to get ont. He always went forth confident in his strength; he came back like the prodigal in his weakness, but with this difference, that the hospital authorities soon got over ordering veal on his arrival.

Running over my letters and memoranda of that period, I find "the old, old story," with endless repetitions, from which I make a few extracts as samsibility, and that regarded moral insanity as only a ples: (Before going out.) "My affairs have got to synonym for depravity. So, doubtingly, I often let a point now where I must lay hold of them and straighten them out. . . As far as whiskey is "Not as other men are,"—but leaving to you, as concerned (I find I must refer to the subject, nausgoing out.) "He appreciated your kindness as much as completely bounded by whiskey as the world of would have come over to pay you a visit; but before eight years the books of the hospital show that he (Some time later.) "Dear Doctor: The poor soul was sent to the institution no less than ten times as 1-1 think I may reasonably say—which accompanies week and took his old room, donned his new fortyon a voluntary commitment. The time thus passed five dollar suit, and got drunk. At two o'clock they with ns amounted to two years and four months, or had to send for the police. He broke the front door, something less than one-third of the whole period, assaulted the cook and the chamber-maid, and pro-There were also voluntary visits, of short duration, duced general hilarity. He has been thoroughly where no record was kept. It is safe to say that dead drunk ever since (not eating anything as far as during the eight years he was for an equal length of 1 can learn); sleeping up an alley in preference to a will see his condition. He has been in the station for thirty hours, and is rational. For the Lord's sake keep him over there for the rest of his life."

So I might go on for an hour illustrating the varying phases of his infirmity from correspondence and yet hoped to find one sufficiently respectable for sode—that of the Montana trip—must suffice:

Twain watching the Arab on his foot race up and we parted, he going on his own wild way to the end. down the pyramids, I said now he will slip, now he He was born with godlike faculties, but he drank must break his neck, certainly in that all day ride in of the cup of Circe till it transformed him to a beast. him be subjected to a severe course of discipline; not think of him as lying cold o' nights. send him to jail; put a ball and chain on him; shoot him if necessary, but don't discharge him." Pretty drunk, but there none the less. And that is the most moving, with all the old time assurance, he replied: "All realistic side of all these cases. Every month—nay, almost every week, they come to me to know what His last residence at St. Elizabeth was one of they shall do that their friends may be saved? Alas! his longest. After much buffeting he had procured that I have no answer I can give. Mothers bring to for himself the necessary order of the District Com me their breaking hearts in confidence that I shall

me the age of martyrdom has not passed; sisters with streaming eyes implore me to save their brother -my brother and your brother too. It is time that as medical men we had some answer to make to this question, What shall be done with them? As scientists curious of the bacillus we forget the worm of the still. As savants we show a pardonable enthusiasm over the shards of a jug on which we may with laborious pains decipher the symbol of Annubis or Osiris, but manifest an inexcusable indifference to that human "treasure" which we have in these frailer than "earthen yessels" on whose shattered fragmen's we might still trace the lines of the image once stamped there. It is time that the scientist and the scholar spoke; that he turned from the contemplation of cliff dwellings and bone caves, and drew out from dens of infamy and caverns of despair where he has been hiding this troglodyte of our time. When the medical men of the community move in earnest in this, we shall have public sentiment, and out of that sentiment will come law, and an answer to the prayer, "Lord, that I might be healed."

NOTE. Let me venture a word in a foot note touching the solution of this problem, lest 1 be accused of leaving my moral lesson without a moral.

The inebriate can be controlled legally in one way or another; there is no doubt about this. For a person who cannot take care of himself the law provides a guardian; or when a man from any cause so far loses self control as to become dangerous to others, society has the right to restrain him. Such dangerous person, either in person in exec, is the inebriate; and at all times he is unable to take care of himself.

Having shut him up, the next thing is to keep him. Hitherto the detention has been too short to afford a chance for reformation. Sentences for thirty days rather aggravate the craving for drink. For any lasting benefit a year's confinement is necessary with some, a lifetime with others. The commitment in confirmed cases should be for a term of years, with a power lodged in the court committing, and perhaps also in the board of managers of the reformatory, to grant furlough or ticket-of-leave, its continuance to depend on good behavior.

Such house of detention should be self-supporting or as nearly so as is possible to make it with a system of compulsory labor. Since idleness is a great incentive to drink, all able bodied inmates should be set to work at some productive industry. Whatever the institution falls short each year of being self sustaining should be made up from the District treasury out of funds received from licenses for the sale of intoxicating drinks.

The entire management of the establishment should be under the immediate control of an executive officer who should be a medical man skilled in his profession, with qualities of heart and brain fitted to his work, and an autocrat in his position. He will need the wisdom of Solomon, the patience of Job, in abiding hope and a double portion of that "charity which never faileth." Anything short of this will land him within five years in a binatic asylim, and his institution in the slough where some so-called inclinate homes are already stranded.

In a majority of these cases a cure is hardly to be expected, for the malady is of many years', often of some generations', standing. But will it be a fight matter to have made these inebrates decent, orderly, and self-supporting in industrial schools while they live, and to have taken their children out of the blight and shadow of a drunkard's home, and given them back their birthright? And for that "saving remainder," fallen but not lost, going forth restored, whose fives from ruined prospects and dead hopes shall rise again— with what line will you measure, in what balances weigh the value of such refuge to them?

CANNED FOODS AS A CAUSE OF ACUTE POISONING.

BY JNO. NORTH, A.M., M.D., F.S.Sc. LOND.

PROPESSOR OF CHEMISTRY, TOXICOLOGY AND LARVINGOLOGY IN THE COL-LEGE OF PHYSICIANS AND SURGEONS, REOKUK, IOWA.

When we take into consideration the enormous amount of canned foods put up and consumed each year, and the comparatively few cases of poisoning, both real and imaginary, that have been attributed to the use of canned foods, we ask the question, Is the use of canned foods injurious? 500,000,000 cans of food are annually consumed as follows:

Οf	salmon	an	average	per	annum	of	50,000,000	cans
"	tomatoes		"	4.6	66	"	52,000,000	44
6 4	corn	4.4	4.6		4.4	"	30,000,000	"
66.	peaches	4.4	4.6	4 6			15,000,000	
6 6	meats, oy	ste	rs, fruits,	veg			253,000,000	

In vegetables alone there are about 400 farms that have small canning factories, putting up the products of the adjoining land fresh from the fields. Adding these to the number of regular canning factories, we have about 800 in all. These figures do not include the canning of fruits, vegetables, etc., by families for their own consumption, which would increase the amount to a considerable extent.

Before coming to any conclusions regarding the injurious effects of canned foods, it will be necessary to consider the various materials out of which the cans are constructed as well as the composition of the contents of the cans. We will not consider the foods canned in glass, but will devote our attention to the foods put up in tin cans. Tin-plate is the form in which tin is used in canning food. It consists of thin sheets of iron covered with tin. There are several methods by which tin-plate is made, the usual one being about as follows: The very best refined sheet iron is first cleared of all oxide by immersing in dilute sulphuric acid, then rubbed dry with sand to remove all traces of the acid. It is then plunged successively into a bath of melted tallow and a bath of tin covered with tallow. On contact with the iron the tin forms a true alloy, which is covered with pure tin. The cheaper grades of tinplate are dipped once or twice, while the best goods are dipped three times. One pound of tin will make twenty eight plates of tin-plate 14 × 22 inches, and of the best grade. Commercial block tin, such as is used in the manufacture of tin plate, usually contains various other metals, but in such small quantities that, with the exception of lead, they are never found in the contents of the cap, so we will not consider them.

A large quantity of tin-plate is made from an alloy of tin and lead, the proportion of lead varying from 1 to 50 per cent. or more. A grade containing about 10 per cent. of lead is as poor as is generally used in making cans. The greater the proportion of lead, the cheaper the tin plate. This alloy of lead and tin is more easily acted upon by the vegetable and fatty acids than pure tin. The principal examiner of chemicals in the U. S. Patent Office says that all commercial tin is alloyed with lead. Chemists who have examined cans for alloy of lead and tin find lead in almost every case. Dr. Onderdunk finds only two samples free from lead in a great number examined.

Dr. Darsh reports that out of a large number of cans vegetable and fatty acids as acidulous or negative tested, he found lead alloyed with tin in almost every radicals. From these we can have tin chloride or case. Dr. Dagget has examined twenty cases of dif-tin salts of the organic acids, lead chloride, or lead ferent brands and found lead alloy in every can. I salts of the organic acids, or we may have zinc chlohave examined a great many different brands of ride or zinc salts formed by the union of zinc with canned foods, also the very best brands of charcoal the organic acids. Rosin used as flux does not comtin used by our tinners, and found lead alloyed with bine with any of the metals; it is only when a liquid the tin in every case; not one was free from lead. flux containing chlorine or a chloride is used, that The most convenient test for lead alloy is to place a we may have all of the above combinations. If few drops of a weak solution of nitric acid (1 to 10) chlorine or a chloride is used as a flux which of the on the tin plate and allow it to remain a few minutes metals, tin, lead or zinc, will it combine with? There to react on the metal. If lead be present the nitrate is a law of chemical affinity known as "Bartholet's of lead will be formed, and by placing a small crystal Law," as follows: "Whenever, on mixing two subof potassium iodide in the centre of the acid, the stances in solution, a compound can be formed by a characteristic yellow iodide of lead will appear. The rearrangment of their atoms, which is insoluble in chemical changes may be expressed by the following the menstruum employed, such a compound will be equations:

(a) $Pb + 2HNO_3 = Pb(NO_3)_2 + H_2$ (b) $Pb(NO_3)_2 + 2Kl = Pbl_2 + 2KNO_3$.

the addition of potassium iodide.

tin cans is an alloy of tin and lead. Three grades insoluble in water and acidulated water. According of solder are in use: common solder, consisting of to the law of Bartholet, the chlorine would enter into equal parts of tin and lead, fine solder, composed of combination with the lead, and if in considerable hand made can was soldered from the outside, and The chlorides, oxides, hydrates and organic salts of rosin used as a flux. It was soon found that the work in, lead and zinc have never been found in sufficient could be done faster by soldering on the bottom and quantities to give rise to the symptoms sometimes top from the inside, still using common solder and produced by eating canned foods. They have never rosin. Still later it was discovered that the same work been found in as large quantities as some of our textcould be done faster and cheaper by using a liquid books give as the medicinal doses of these same salts. caps are usually soldered on by means of the chloride of zinc flux. Some of this frequently finds its way the metallic salts. under the cap and into the contents of the can. The Legislature of Maryland has passed a law prohibiting occurring in acute poisoning from canned foods: the use of this flux in canning foods. There has been a great deal of groundless prejudice against the delirium, stupor, coma. use of machine-made cans. An attempt has even been made to boycott all cans made by machinery. I have tested samples of the tin plate, solder and flux used by one of the largest manufacturers of machine-made cans, and find the materials to be practically unobjectionable.

It would be impossible to give the analysis and composition of all the foods preserved by the canning process. Most, if not all of them, contain organic acids of either the vegetable or fatty acid series. The acids found are either natural in the fruits, vegetables or meats, or are the result of chemical change. In replying to the question, "Is the use of canned of lungs. foods injurious?" we must take into consideration not only the thi-plate, solder, and flux used, but also the nature and composition of the food in its natural condition, and after partial decomposition has taken place. When we take elementary substances alone we find them harmless, as a rule. It is when new combinations take place, or old compounds are decomposed and poisonous ones are formed as the result | sugar nor albumen. of recomposition, that we look for harm. In the present as baselous or positive radicals, and chlorine, sions, partial paralysis of extremities.

formed and will appear as a precipitate." The liquid or juice in canned foods consists of water and in most cases of an acid. Chloride of zinc is soluble If the tin is pure there will be no change of color on in water and acidulated water. Stannic chloride is soluble in water and acidulated water, stannous chlo-The ordinary solder used in the manufacture of ride in acidulated water. Lead chloride is almost two parts of tin to one of lead, and "coarse" solder, quantity would be precipitated. Our works on toxicontaining one part tin and two of lead. The old cology do not mention lead chloride as a poison. flux, consisting of chloride of zinc and water. The And again, we find that the symptoms of canned food poisoning differ materially from the toxic effects of

The following symptoms have been recorded as

Brain—Headache, throbbing of temples, vertigo,

Face—Livid.

Eves—Red, suffused, lids swollen, pupils dilated. Tongue—Fiery red, heavily coated.

Threat—Dry, burning sensation, extreme thirst.

Stemach—Want of appetite, repeated eructations, nausea, retching, violent vomiting, both bilious and alimentary.

Bowels—Tender, painful, griping, diarrhœa, violent colic, gastro-enteritis, very offensive stools, bloody stools, dark tawny liquid from bowels, stricture of rectum and colon, tenesmus, prolapse of rectum.

Respiration—Alternate strangulation and paralysis

Temperature—Normal, 101° to 105° F.

Tulse-Weak and slow, thin, thready, 100 to 150. Integument—No heat of skin, skin hot and dry, profuse sweating, fiery red cruption all over body, intolerable itching, rough skin, greenish or yellowish patches.

Kidneys - Urine scanty, loaded with urates, no

Muscles—Convulsive tremors, all movements painsubstances mentioned we have tin, lead and zinc ful, cramps of thighs and legs, epileptiform convul-

General Symptoms—Cross, irritable, great languor, extreme weakness, typhoid condition, cold extremities, etc.

We find most of these symptoms in cases of poisoning by the narcotic alkaloids of hyoscyamus, conium, stramomum, etc. The symptoms of acute poisoning by canned foods are not such as we find in corrosive metallic poisoning, but are such as would arise from the action of some substance having especial effect on the nervous system.

If poisoning does occur from eating canned foods, and does not arise from the tin-plate, solder, fluxes, or organic acids or their combinations, where does the poison come from, and what is its nature?

Putrefaction is the spontaneous (so-called) decomposition taking place in nitrogenous substances. As the result of this process we have artificial alkaloids, and extractive matter formed. Alkaloids are alkaline established.) or basic substances found in organic matter. The natural alkaloids already exist in organic substances; generally that of decomposition. alkaloids are formed by the putrefaction of dead anof life force, they are called "leucomaines," or "ani- it is usually attributed to metallic poisoning. mal alkaloids." HÆMATEMESIS.1

BY SAMUEL S. ADAMS, M.D.,

OF WASHINGTON, D. C.

In offering for your consideration a case of hæmatemesis, I have nothing unique to present, nor is there anything new in its pathology or morbid anatomy. The interest in the case is mostly centred in the rapidity with which the bleeding stopped after the her faint, and was very sleepy most of the time—all administration of the hæmostatic, and the speedy reaction from impending collapse.

medical advice until I was summoned to see her just to her room, but did not retire till after midnight. after a profuse bloody vomit on the evening of Noyellow fever.

From her infancy she had always been considered delicate, but cannot recall any sickness until 1881, when she was taken ill just as in the present attack. She had apparently been well and was engaged in she vomited blood a second time that day. During this illness she was confined to her bed for one week, enjoyed excellent health, with occasional slight at-

Only words of commendation can be spoken of tailing a large number of analyses of sixteen varieties her ambition and industry, which have led her into of foods, in which he arrives at the following concluirregular habits of living and to an almost absolute sions: "The public has not the very faintest cause disregard of the rules for the preservation of health. for alarm respecting the occurrence of tin, lead, or It has been her custom to sit up until 1 or 2 o'clock at night engaged either in reading or fancy work. Dr. Thos. Stevenson, Government Toxicological She would go to her office after taking a cup of coffee, and never more than one biscuit. She has been compelled to sit all day on the ground floor of the worst meal. Her bright color, powers of endurance, cheer-In conclusion, if care is used in canning foods, and ful disposition and apparent good health have excited the admiration and envy of her female friends. canning, they will not give rise to acute poisoning. Whenever they would admonish her for disregarding the hygiene of life, she would reply that she was always well. On one occasion when she was boasting of her good health in spite of her irregular mode of living, the writer warned her that nature would not always be so obedient to her wishes, but would ere long assert her rights. Little did he think then that the prediction would be fulfilled so soon.

For a few days she had had "sour stomach," belching, suffocative feelings, pain in the back of the head and in the cardiac region which almost made of which she attributed to "dyspepsia and biliousness." On October 30, after taking her usual break-Miss O'K., aged about 26, a brunette, of Irish fast, she went to a studio where she painted for seven parentage, with an excellent physique and high color, hours. She returned late in the afternoon feeling was taken ill October 31, 1886, but did not have any very tired, but ate a good dinner and then repaired

October 31. She did not get up until 10 A.M., vember 1. Her family history does not point directly when she felt very uncomfortable from a feeling of to a hæmorrhagic diathesis, although some years ago, oppression in the epigastrium which she thought was in the case of a sister, I had great difficulty in con-indigestion. At breakfast she only drank a cup of trolling a profuse and alarming hemorrhage from the coffee. She remained in the parlor till 1 P.M.; then gums, following the extraction of a tooth, which had went upstairs and took a warm bath and dressed for continued forty-eight hours. Her mother died of dinner. She now felt very weak, but thought it was consumption; her father is said to have died of from hunger, as she had not had a bit of solid food Bright's disease; and a brother of apoplexy following for twenty two hours. While seated at the dinner table waiting for her soup, she was seized with a feeling of suffocation, nausea and dizziness. She left the room and went into the parlor to her sisters. They, supposing that she was about to faint, procured some hot water, which she drank. In about ten minutes household duties when she was suddenly nauseated, she became very much nauseated. She went up to and soon after vomited a large quantity of blood; the third story of the house, where she vomited seemingly a pint of blood. This frightened her, but she was quieted by her sisters, who expressed the but did not regain her strength and vigor for several opinion that the blood was from the nose, as it came months. From her recovery to the present she had from that passage as well as from the mouth in the effort of vomiting. She then went to her room and tacks of indigestion. She began to menstruate quite rested till 6 o'clock, when she felt somewhat better; early; the periods and flows have always been nor-she would have kept to her bed but for the solicitamal, and she has never had any uterine disease. She tions of one of her sisters, who was anxious to see her in a new dress; so she put it on and went to tea, but could not eat. She remained in the parlor until

1525 I St., Washington, D. C.

EXPLORATORY INCISION AS A DERNIER RESSORT FOR DIAGNOSTIC PURPOSES.

BY R. STANSBURY SUTTON, M.D.,

OF PITTSBURGH, FA.

Many cases will present themselves in which a diagnosis is not possible. It will not be possible to determine anything beyond a certainty that the disease is within the abdominal or pelvic cavity. A tunior may be present; no certainty of its relations may be ascertainable through the closed abdominal wall. What is to be done? Will we satisfy our consciences that our duty is done and turn away, or temporize with drugs? It is to be hoped not. In every man or woman dying or in danger of dying from an obscure A BULLET AND FRAGMENTS OF A KNIFE IMBEDDED intra abdominal trouble an exploratory incision should be made and the diagnosis should, if possible, through it, by touch, or touch and vision, be perfected. Is such a procedure to be lightly undertaken? By no means. But with the following precautions it is safe:

1. Have the patient clean from head to foot, and the surface of the abdomen especially clean, made, so by soap and water and a brush. Surround the parts with clean towels fresh from the hot iron.

- 2. Have your hands and forearms scrupulously
- 3. Have your instruments clean and immersed in
 - 4. Thoroughly etherize your patient.
- 5. Make an incision two inches long; before open-Pass in two fingers and make search.
- 6. If you have failed to gain the desired information, withdraw your fingers, pass in a sponge, locate moved from the night of the 1st until that of the 7th, it directly under, below and above the wound, and enlarge the latter with a clean cut over the sponge, but they were either voided immediately without to a length sufficient to let in your hand. Secure all bleeding vessels, withdraw the sponge, and pass in the hand and complete the search. Through such a ala and thereby prove a troublesome complication, wound much may also be seen. Never make a longer
 - 7. Before closing the abdomen cleanse the cavity
- 8. Reject the use of carbolic acid or bichloride of in aromatic sulphuric acid, syrup and water, which source of danger. They may be useful in cleansing out of the peritoneal sac. Keith, Tait, Bantock, and others abroad have proved the worthlessness of carbolic acid, and I have for some time been satisfied
 - 9. Never permit any one but the operator to pass a hand into the cavity, unless his hand has been prepared by a careful cleansing with soap and water and brush, and with turpentine or a 1.200 solution of bichloride of mercury. Even a 1 in 20 per cent. solution of carbolic acid is not reliable for this purpose.

10. In tying the sutures, dry the lips of the wound as you go along with a bit of iodoform gauze.

With the above precautions I have opened the abdomen many times, and I have yet to see a single wound so treated fail to unite by first intention.

HOSPITAL REPORTS.

MERCY HOSPITAL CLINIC.

urated solution of lithium carbonate.

The time required for staining varies with different specimens; in general, the rule prevails that the longer one colors, the surer the result; for cord sections, two or three hours are usually sufficient; in brain sections, twenty four hours are required in order to color the very fine fibres of the cortex.

After staining, the sections, now black in color, are differentiated by immersion in the following solution: borax, two parts; ferricyanide of potassium (red prissiate), two and one-half parts; water, one hundred parts. It will be found that the time required for perfect differentiation varies in different specimens; in cord sections, it usually takes onehalf hour to several hours before the desired contrast between white and gray matter is obtained, and in brain sections it is longer. No fear of spoiling the sections need be felt. I have frequently allowed sections to remain in this solution for twelve hours without ill result.

From this solution the sections are transferred to water and well washed; then to 80 per cent. or 90 per cent, alcohol; they are then spread on slides and dehydrated thoroughly with absolute alcohol, and then clarified. I prefer xylol or creasote for clarifying, and xylol or benzole balsam for mounting.

If the steps in this method are carefully followed, success is certain; and it is without exception the method for tracing nerve fibres or demonstrating nerve lesions.—Medical News, Nov. 6, 1886.

LYCOPUS VIRGINICUS IN THE TREATMENT OF VENomous Bites and Stings — Dr. J. R. Briggs, of Ft. Worth, Texas (Trans. of the Texas State Med. Assoc., 1886), calls attention to the efficiency of Lycopusvirginicus, commonly called bugle-weed (the charmweed of the Indians), in the treatment of the effects of the bites and stings of venomous reptiles and insects. "Any one," he says, "who has attended the fairs and other gatherings held throughout Georgia, Tennessee, and Kentucky during the egress of the Indians from that country doubtless remembers that on such occasions there were many Indians who would, with impunity, allow the poisonous rattlesnake to bite them. It was observed that, in order to counteract the effects of this poisonous reptile, they masticated large quantities of the bugle-weed and Jour., Oct. 30, 1886. swallowed the juice. That the bugle-weed was the identical weed used at the time, I have absolute proof." He then gives a brief account of the case of a man who was suffering severely from the effects. of the sting of a large centipede. Ordinary stimu lants, such as whisky and ammonia, having produced no perceptible results, Dr. Briggs gave a decoction hour, and applied it on linen cloths to the trail of the redness. - Revue des Sc. Médicales, T. 38, No. 1.

> Eggs in the Dietary in Bright's Disease.—In order to solve the problem of alimentation in the subjects of Bright's disease, Löwenmeyer placed a number of patients upon a regimen which was as regular as possible, and added to the diet-list from six to nine eggs a day. In four of the patients, of whom three suffered from anryloid kidney and one from nephritis consecutive to cardiac disease, the addition of eggs to the dietary was followed by no increase in the excretion of albumen in the urine. In three others there was a notable increase; but the experimenter excluded two of them, one because the patient was not carefully watched, and the other because menstruction occurred just after the beginning of the ex-In the third case, one of interstitial periment. nephritis, the author remarks that the increase in albumen might be accounted for by the fact that the patient took the eggs raw, while the others ate them cooked. He concludes, as a result of these experiments, that an alimentation even very rich in albumenoid matters causes no increase in the amount of albumen in the urine.—Lyon Medical, No. 36, 1886.—Medical Record, Dec. 11, 1886.

> RHUBARB IN THE TREATMENT OF THREAD-WORMS. Dr. Sidney Martin, (Practitioner, October, 1886), thinks that in many cases, although the irritation about the anus may have been relieved by injections, the persistent irregularity of the bowels and disturbance of sleep are owing to the fact that worms still remain in a higher part of the intestine. In such cases he has found that small doses of thubarb are efficient in bringing the worms away and in regulating the bowels, so that in most instances injections may be dispensed with. He has found the following formula most useful, varied slightly according to the age of the child:

Tineture of rhubarb...... 3 minims; Magnesium carbonate...... 3 grains; Tincture of gmger..... I minim;

This amount is to be taken two or three times a day, according to the effect on the bowels. Whether the rhubarb acts as a vermicide or simply by "moving the worms on," he is unable to say.—N. Y. Med.

Cocaine in Mercurial Stomatitis.—Bockhart has found that painting the gums with a 5 to 10 per cent, solution of cocaine a few minutes before eating will enable the patient to eat without trouble or pain. Revue des Sciences Med., July, 1886.

CHRYSAROBIN IN INFANTILE ECZEMA.—STAQUART of bugle-weed (made with an ounce of the plant to reports that in doses of 5 millig, to 2 centig, in young a pint of water, a small quantity of alcohol being children, and 4 centig in children 7 years old, chrysadded to preserve it) in tablespoonful doses every arobin causes rapid dessication of the inflammatory THE

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No. 65 RANDOLPH STREET.

CHICAGO, ILLINOIS.

SATURDAY, JANUARY 8, 1887.

THE SURGERY OF THE PANCREAS.

The most important surgical paper of last year, in this country at least, was read by Dr. Nicholas Senn, of Milwaukee, before the American Surgical Association at its last annual meeting, and has now been issued as a reprint from the Transactions of the As-Those who are familiar with former papers of Dr. Senn, with the records of his careful experiments, and with his lucid style, need not be told more as to the importance of the paper. But whether our readers be or be not familiar with his writings, they will at once recognize that a carefully written paper of 129 octavo pages on the surgery of serious than complete removal, though physiologically the pancreas must contain much valuable material, the consequences may be the same if the portion reand positive additions to our knowledge of this very moved embrace the common duct or the two princiobscure subject. The surgery of the panereas has pal duets from the two portions of the gland. In all no history except as to the treatment of a few cases of Dr. Senn's experiments the common duct was reof cysts of the gland, but the results in these cases moved with the excised portion, and thus left the have been so encouraging that there is much hope animal, physiologically, without a pancreas. In two for the future of the surgery of the organ.

tion of the pancreas tend to show that this lesion, assimilation. In each of these animals "the general unless complicated by other and more serious lesions, health and nutrition remained unimpaired for four is not dangerous to life if the chief source of danger, weeks, when emaciation, with fatty stools, followed, hæmorrhage, be properly treated. "The coaptation which resulted in death from marasmus in, after of the divided ends would be desirable, but is not es-, seventy days, and reduced the second to a skeleton sential, as the continuity of the duct is not restored in 126 days." As from the beginning no pancreatic after this injury." No disturbance of digestion was juice passed into the intestine it is difficult to account noted in either of the two experimental cases, since for the good condition of the animals for the first a sufficient amount of pancreatic juice was secreted four weeks. Had the marasmus been due to the refrom that portion of the organ in communication with 'section of the mesentery of the duodenum, by diminuthe intestine. In case of this injury the most im-tion of intestinal absorption, it should have begun portant indication is to arrest bleeding, and to suture earlier. We may assume that the pancreatic tissue the two cut ends of organ so as to keep them in left continued to secrete until it was incapacitated by

place, and thus maintain normal blood supply. In Journal of the American Medical Association, an experiment with regard to the effect of laceration of the pancreas death resulted from the accidental re-opening of the abdominal wound. "Hæmorrhage was arrested spontaneously, and the process of repair, so far as the wound in the pancreas was concerned, appeared to be satisfactory. The divided ends were displaced considerably immediately after the laceration, but were subsequently brought into close contact by the cicatricial contraction." Believing that putrefaction cannot occur without specific germs, Dr. Senn crushed the pancreas of a eat to the extent of two inches in order to test the matter. The animal lived until it was killed, on the eightysixth day. It was found that the crushed portion was removed by absorption, which seems to be very rapid in this locality, and which may be explained by assuming that the peritoneum takes an active part in the process. No infection took place, nor could any evidence of putrefaction be found. "Subsequent degeneration, atrophy and sclerosis, take place in that portion of the gland which is no longer connected with the intestine by a permeable duct."

It was found that complete extirpation of the pancreas is invariably fatal, though Schiff has asserted the contrary; and it is important to know that in the two specimens from experiments which showed evidence of gangrene, this was seen on the convex surface of the bowel, but did not in either case involve the entire diameter of the intestine. Surgically speaking, partial extirpation of the pancreas is less eases the animals lived long enough to show the in-The experiments of Dr. Senn as to complete sec- fluence of the pancreatic juice upon digestion and

"Whenever the sac can be stitched to the external incision this should be done, and the sac opened, disinfected, and drained. Search should be made for the necrosed pancreas, and when found detached it should be removed. As in most of these cases the retroperitoneal tissue is extensively infiltrated, a counter-opening should be made in the lumbar region above the kidney, and thorough drainage established. If an ante rior abdominal fistula cannot be established, the course to be pursued should be the same as in treating a pancreatic abscess under similar conditions."

In a subsequent issue we will notice that portion of this valuable paper which deals with other pathological conditions of the pancreas.

SOUR GRAPES.

The editor of the Boston Medical and Surgical Journal, in the number for December 30, 1886, devotes six pages to an enumeration of the more important events of a medical character during the year, in which is included one rather facetious paragraph concerning the International Medical Congress to be held in 1887. With characteristic unfairness he says: "For this reason, as well as in accordance with the territorial policy of the management, the cities of the Atlantic coast will have but a small representation in the honors of the Congress." Had our learned confrère taken the trouble to examine the list of general and executive American officers of the Congress, including the Vice-Presidents, and also the Presidents of the Sections, he would have found them to num ber thirty-three, twenty-one of whom are residents gone forth from more than one State, that the genof the Atlantic States, and seventeen of the twentyone are residents of the five Atlantic cities, Boston, New York, Philadelphia, Baltimore, and Washington; while only twelve of the thirty-three chief Amer-It is certainly amusing to see with what emy of Medicine, January 19, 1887. peats the statement, originating with some mischiev- members.

the elimination of the necrosed organ, it seems not ous wag, "that Dr. Pancoast, of Philadelphia, had

INTERNATIONAL MEDICAL CONGRESS-VACANCIES FILLED.—J. J. CHISOLM, M.D., of Baltimore, Md., has been appointed President of the Section of Ophthalmology of the Ninth International Medical Congress, in the place of Dr. E. Williams, who was compelled to resign on account of ill health. JUDSON B. Andrews, M.D., Superintendent of the Hospital for the Insane, Buffalo, N. Y., has been appointed to the office of President of the Section of Psychological Medicine and Nervous Diseases, made vacant by the recent death of Dr. John P. Gray. These are excellent appointments, both parties being widely known and eminently well qualified for the respective positions assigned to them. No vacancies now remain in the list of chief officers of the Preliminary Organization of the Congress or of its Sections; and our information from all departments is of the most encouraging character.

Professor J. S. Jewell. Editor of the Neuro-LOGICAL REVIEW.—We much regret to learn that this eminent and most indefatigable worker continues to suffer so much from ill health, that he is constrained to give notice of an indefinite suspension of the publication of the Review. With a mental activity and erudition seldom equaled, he is compelled to yield to physical infirmities that would have long since overwhelmed any man of less tireless energy and steadfastness of purpose. We hope more rest, and perhaps a milder climate, may yet restore his physical health and endurance.

As OTHERS SEE Us. -- What is wanted in America, says the Lancet, is the establishment of some general principles of action rather than the intermittent and varying action of a number of separate States; and we entirely sympathize with the request which has eral health defences of the country should be subject to some central organization.

I had been as cautious about the force and the patient recovered in the course of a month. as I could be, making the effort as gradually as possi- Having spoken of one spontaneous cure, I will tell ble but I perforated the fundus. I fully expected you of a patient that I attended in Mercy Hospital that the damage done would be fatal to the patient, in 1864-5, whose uterus was much in the same way but it did not produce any bad effects whatever and as the one that I first operated on, coming out enshe entirely recovered in two weeks and went home, tirely beyond the vulva and dragging down the Two years later she came to see me again, but did vagina very low, so that there was simply a circular not wish to have another effort made to have the sulcus between the labia and the vaginal wall. I uterus reduced. Two years later the uterus was tried to restore it by manipulation and failed; I profound in its normal position. I saw the patient and posed to amputate it but the patient would not conher physician, and I am certain that nothing had sent. Meantime one of the internes had fallen in been done to reduce it. I tried two other cases, and love with her and they went off to Missouri and got made the same efforts but without success. I then married. About six years afterwards, the doctor concluded that it was hardly worth while to make came back and told me that he had a son and his trials of that nature again, and in the next case I name was Byford. Upon inquiry I found that the tried the colpeurysis treatment. For some days I child had been borne by this woman. One case of was nonplussed, from want of experience, as to the inversion occurred in my own practice. I attended mode of placing the instrument in the vagina. I the patient during confinement, and as far as I know used the quadrilateral colpeurynter, and after I placed she had no difficulties whatever for seven or eight it in the vagina, I found the next day that I had got days. By that time I was on my road to California, ten it under the uterus lengthwise, that the fundus and I think Dr. Roler looked after her for some little was directed toward the vulva, and the neck directly time after I was gone. In two months I returned backwards. I was merely compressing the body of home and was informed that she had inversion of the the uterus against the symphysis pubis. I reflected uterus, which I did not believe. I went to see her considerably before I could get the right idea as to and found that she was suffering from complete inthe manner of placing the instrument in the vagina, version. That was one of the cases I cured by Finally I pushed back the fundus until the axis of the colpeurysis. When the inversion occurred I do not uterus corresponded to the axis of the superior strait, 'not know. I am certain that I made two or three

examinations as I always did at that time, always the hand into the rectum. I am not alluding to one the second day after confinement. I did not Simon's method, putting the hand in as far as the notice anything of the kind, and yet it might have elbow, but I am talking of the hand. And when the been commenced and finished afterwards. I saw a patient is under ether, it can be done easily. It decase with Dr. Henry Byford, which had been attended pends upon the size of the hand, perhaps, but with a by a midwife, in which the inversion occurred so that hand well greased and introduced slowly it does a the fundus could be touched through the mouth of great deal of good, and gives an immense deal of inthe uterus, and it remained in that way two or three formation which we cannot get in any other way. I weeks. The patient was bleeding, but I believed examine every case, without conception, per rectum, the contraction of the mouth of the uterus was suffici- with the finger. ent to prevent it coming through, I advised ergot, position.

DR EDWARD WARREN SAWYER: One point is amputate? the persistence that one can observe in applying the also shows the possibility of the obstetrician, seeing recorded in which the inversion has taken place without the obstetrician knowing it. In the fatal case profound that it was impossible to overlook it, and I think the diagnosis of recent puerperal inversion of

In the case which occurred in my practice, the rim of the crater marking the upper border of the uterus, which I palpated through the abdomen, was fully as large as a common bowl, and its edges were very sharply defined. In addition to that the fundus could be distinctly felt through the os uteri. One feature of the paper, which is by no means the least to be commended, is the very admirable and graphic way in which the case was presented.

DR. H. P. NEWMAN: My experience has been limited, but I remember a single case, in which I assisted a surgeon of this city in attempting the reduction of a chronic inversion of the uterus. It was in and specimens of a hospital, where they had every facility for the operation and it could be proceeded with leisurely. Some two hours were taken up with the various deor the uterus amputated.

THE PRESIDENT asked Dr. W. H. Byford if he reand in a few days the uterus was in its proper garded it good practice after all ordinary means had been exhausted and the aterus was still inverted, to

Dr. W. H. Byford: When all other measures colpeurysis, without a fatal result following. The in- have failed to effect the object and the patient is teresting case that Dr. Byford has spoken of last, suffering so much as to make relief imperative, yes.

THE PRESIDENT: I saw Prof. Chiara, in Florence, nothing in the first few days of the puerperal state to operate upon a case of that sort. He placed a silver suggest that anything has gone wrong. Cases are wire around the uterus and left it in position and the parts gradually sloughed away.

Dr. W. H. Byrord thought that mode of operating that occurred in my practice, the symptoms were so upon the uterus bad, that it would have been better to have used the wire ecraseur to stop circulation, and cut it off. But a sloughing mass in contact with the uterus is much easier than of chronic inversion, the parts would be likely to produce pyamia.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, November 10, 1886.

THE PRESIDENT, C. H. A. KLEINSCHMIDT, M.D., IN THE CHAIR.

11. M. Cutts, M.D., Secretary.

Dr. D. S. Lamb presented the history of a case

(FROM OUR OWN CORRESPONDENT.)

Pathology of Scarlatinal Nephritis— Removal of the Vermiform Appendix.

At the last meeting of the New York County Medical Association Dr. Frank Grauer, of the Carnegie Laboratory, who during the past summer has been making special researches on the subject in Fried länder's laboratory in Berlin, presented a valuable **c**ontribution to our knowledge of the *Fathological* Anatomy of Scarlatinal Nephritis. He followed nephritis; or nephritis post-scarlatinosa.

The is not as common as either of the others; Friedranconjoint boards are shortly to meet again in connect der having found it present in only twelve out of 229 autopsies made by him in cases of scarlatinal nephri-It generally occurs from the first to the fourth week of the disease, and runs a rapid course; in some cases the urine remaining normal until within twenty-four or forty-eight hours of death. It is generally found in those cases accompanied by extensive angina and diphtheritic inflammation, and the postmortem appearances are as follows: The kidneys are enlarged, and the cortex is studded with ecchymoses and large hæmorrhagic infiltrations. The cortical substance is thickened and greyish red in color, there is complete loss of the strice, and the glomeruli are, as a rule, invisible.

Microscopically, Dr. Grauer said, the tubules were found to contain the various forms of casts, and blood corpuscles, degenerated and desquamated epithelium, and an increase in the connective tissue characterized by a round cell infiltration which was Friedländer's classification in general; dividing the situated mainly around the glomeruli and between varieties of the affection met with post-mortem into the convoluted tubules. In addition, small abscesses three types, viz.: initial catarrhal nephritis; large, were often found in the cortical substance, in which, flabby, hæmorrhagic kidney; and acute glomerulo- by means of one of the aniline dyes, micrococci could not infrequently be detected. PAROTIDITIS AND PREGNANCY.

To the Editor of the Journal:

interest and rarity: Mrs. S., aged 29, three months pregnant, was taken with parotiditis. On the third day the swelling abandoned the parotid glands, and centreing in Columbus, and will be granted to all miscarriage followed. She has had four previous pregnancies, of which the first, third and fourth were normal. The second pregnancy miscarried, which was attributed to fright. Are there any instances in which metastasis from the parotid glands to the uterus has occurred with results like the above?— Very truly yours, J. Frank Page, M.D.

MISCELLANEOUS.

Ohio State Sanitary Association.—The fourth annual meeting of the Ohio State Sanitary Association will be held in the Board of Trade Room, City Hall, Columbus, Ohio, on Thursday and Friday, Feb. 10 and 11, 1887. Among others the following papers will be read:

"The cause of deafness and blindness with special reference to the eruptive fevers." S. L. McCurdy, M.D., Surgeon for the Penna Co., Dennison, Ohio.

"Cremation of the lower animals." E. S. Rickets, M.D., Portsmouth, O.

"Water Closets and Privy Vaults." John McCurdy, M.D., Youngstown, Ohio.

"Injurious Gases." David O'Brine, M.E., M.Sc., M.D., Assistant Professor of Chemistry, Ohio State University, Columbus, O.

"Our Fever Epidemic from Drinking Sewerage." C. E. Kurz, M.D., Bellaire, O.

"The Sanitary Condition of Sandusky before and after the Completion of Water Works and a Sewerage System." Elwood Stanley M.D., U. S. Marine Hospital Service, Ohio.

"Syphilis from a Sanitary Standpoint."

Beardsley, M.D., Ottawa, O.

"School Sanitation." Hon. LeRoy D. Brown, Ph.D., Ex State School Commissioner, Hamilton, O.

"Some of the Practical Results of our Criminal Laws from a Sanitary Standpoint." R. Harvey Reed, M.D., Mansfield, O.

"Diagnostic Responsibility." H. M. Lash, M.D., Athens, O.

"Examination of Air of Apartments." Curtis C. Howard, M.C., Professor of Chemistry, Starling Medical College, Columbus, O.

"Hygiene of the Sick-Room." F. C. Larimore,

"The Sanitary Condition of the City of Mexico, form appendix; 8, the absence of the evidence of from Personal Investigation." E. D. Shreve, C.E., Bucyrus, O.

"Ptomaines and Poisoning by Tainted Foods." J.

Columbus Medical College, Columbus, O.

"The Relation of Climatic Changes to Certain Diseases, with chart illustrations." E. M. Mark, Esq., Sec'y Ohio Meteorological Bureau, Columbus, Ohio.

"The Chronic Insane under County Care and in Dear Sir:—The following case is to me one of the Care of Families." F. H. Darby, M.D., Chair-

man of Sanitary Committee, Morrow, O.

Reduced rates have been secured on all lines persons desiring to attend the meeting, who, on application to the Secretary, at least one week prior to the time of the meeting, will be furnished with the proper certificates, which must be secured before leaving home.

REGISTRATION OF BIRTHS AND DEATHS IN ILLI-NOIS.—In the city of Chicago the death reports are as complete as they can be made, owing to the burial permit system, but there are about one-fourth of the returns of births lacking. This is mainly owing to neglect upon the part of the profession, as the midwives as a rule make these returns promptly. An effort will again be made at the coming session of the General Assembly to so amend the law as to relieve the certifying physician of unnecessary labor in connection with these returns, and the Illinois State Board of Health cordially invites the exercise of influence to this end. The returns last year indicate an increase of 25 per cent. over the previous year, in consequence of a circular letter sent to the delinquents in February and March. It is to be hoped that all returns will be made promptly.

OFFICIAL LIST OF CHANGES IN THE STATIONS AND DUTIES OF OFFICERS SERVING IN THE MEDICAL DEPARTMENT. U. S. ARMY, FROM DECEMBER 25, 1886, TO DECFMBER 31, 1886.

Major Egon A. Koerper, Surgeon, U. S. Army, granted leave of absence for two months, to take effect about January 1, 1887. S. O. 297, A. G. O., Dec. 27, 1886.

First Lieut. Jno. L. Phillips, Asst. Surgeon, granted one month's extension of his leave of absence. S. O. 297, A. G. O., Dec. 27, 1886.

OFFICIAL LIST OF CHANGES IN THE MEDICAL CORPS OF THE U. S. NAVY, DURING THE WEEK ENDING JANUARY 1, 1887.

Anderson, F., P. A. Surgeon, to U. S. S. "Thetis."

ADDRESSES.

STATE REGULATION OF MEDICAL PRACTICE.

The Retiring President's Address, delivered at the Tenth Annual Meeting of the Detroit Medical and Library Association, Oct. 4, 1886,

BY C. J. LUNDY, A.M., M.D.

Ladies and Gentlemen, Members of the Detroit Medical and Library Association:

We are assembled this evening to celebrate our society's tenth anniversary, and, I trust, the year about to close has been one of pleasure and profit to us all. When one year ago you conferred upon me the honor of the presidency of this society, I accepted the office with doubt and misgivings. The year preceding my installment in office had been one of unusual activity and prosperity. Such prosperity has seldom been enjoyed by a local society, especially outside the large cities of the East. Numerous valuable papers had been presented; interesting discussions, upon given topics, had been held, and a large amount of pathological material had been exhibited during the year. The membership of the society had greatly increased and the regular attend ance had been unusually large during the incumbency of my predecessor. No wonder, then, that I should have entertained fears lest the year during which I was to preside over your deliberations might witness a diminution in the interest and good work of the society. Still, I was m no small degree encouraged by the fact that we had an indefatigable secretary, to whom this society owes so much, and also by the fact that we have a large number of members interested in society work-members who had large resources from which to draw—and I think you will agree with me when I say they have drawn upon these resources most generously, and they have made this another prosperous year for this society. Such work as you have done during the past year could not fail to prove interesting, profitable and instructive, and it is somewhat surprising that so many busy time to society work.

chosen by the advisory council. More than seventy away feeling I had been instructed by the papers,

pathological specimens and microscopic mountings were presented. A large number of patients was exhibited, either to illustrate some interesting disease, or to show the results of some important surgical operation. Indeed, the number and character of the pathological specimens alone would have done credit to a pathological society. I doubt if any local society in the country has done more profitable, interesting and instructive work during the year than has the Detroit Medical and Library Association.

In addition to the many valuable papers presented by our resident members, we have had the pleasure of listening to able papers from several gentlemen residing outside the city. Among others were one by Dr. T. K. Holmes, President of the Canadian Medical Association; one by Prof. V. C. Vaughan, of the State University; one by Dr. Henry M. Hurd, Superintendent of the Eastern Michigan Asylum; one by Dr. George Tye, President of the Ontario Medical Society; and one by Dr. E. P. Christian, President of the State Medical Society. While the inviting of eminent men outside the city to read papers before us is not exactly a new departure, yet it has been done to a much greater extent this year than heretofore In my opinion it is a good course to pursue, and I am sure all will admit that we were both entertained and instructed by the able papers presented by the gentlemen named. We have also been delighted and encouraged by the frequent presence of gentlemen, prominent in the profession, who are not members of this society. Many of these are either officers of, or prominently connected with, sister societies, and their presence at our meetings has always been a source of great pleasure to me.

Our society has increased its membership by the election of thirty new members. Of these nineteen were elected as active members, ten as corresponding members, and one was elected as an honorary member. We have now a total membership of 136. It is possible that some may contend that a society with a large membership may prove unwieldy, but I certainly do not entertain such views. Instead of having a few members present, we have had an average attendance of thirty one. On several occasions practitioners have found it possible to devote so much the attendance has been between forty and fifty. When so many gentlemen interest themselves in so-According to the secretary's report, I find that ciety work, it may be relied upon that the meetings there were read during the year twenty-three papers will be of interest and profit to all concerned. I on numerous and interesting topics. There were have attended most of the meetings during the year, held five discussions upon various subjects, mostly and I have no hesitation in saying that I always went untlagging interest could have been kept up through- their lives and rob them of their money.'

Can the fault be charged to our legislators? Can it be possible that the men who, by all manner of false representations and deceptive promises, were taking advantage of the mission of the people of the state from the one man and crush it. Can the fault be charged to our legislators? Can it be possible that the men who, by all manner of false representations and deceptive promises, were taking advantage of the mission of the people of the shameless depredations of swindlers and adventurers of the people of the shameless depredations of swindlers and adventurers of the people of the shameless depredations of swindlers and adventurers of the possible that the men who, by all manner of false representations and deceptive promises, were taking advantage of the mission of the people of the people

discussions and reports of cases. I doubt if this kinds, to still further injure their health, endanger

To me it is incomprehensible that in Michigan all Now, while our society has done much good work attempts to regulate the practice of medicine, to suphealth, the morals and the property of the people of In this great State of Michigan, in which we have that State from the shameless depredations of swinpay out to swindling mountebanks and quacks as "The Medical Practice Act was primarily a police much money as would pay for all the school houses fortunes of the people in sickness and ailments of all intelligence of our people? Or can it be possible that the majority of these legislators have venal mo- the same basis of calculation which applied to Illithe chief of a corporation of quacks spoke truly when 600 annually. he said he had "fixed the legislature and defeated." the medical bill, but that it took money to do it?" of money of which we have been robbed in ten years,

and that is, the State of Michigan has thus far ut-school houses, high schools, academies and colleges terly failed to grant to her citizens that protection of this State, even including our State University. from swindling mountebanks and quacks which she. Thirty seven and a half millions of money is equal is in duty bound to afford them. Michigan should to four times the cost of erecting all of the penal, learn wisdom from other States; and her legislators pauper and charitable institutions of Michigan, even should show that degree of intelligence which was including the three asylums for the insane. Thirtyshown by the legislators of Illinois, when they passed seven and a half million dollars would cover the cost the "Medical Practice Act" nine years ago. It is of erecting all the church edifices in the State. Onetrue, a pretence for a bill against quackery became a third the money which is annually paid to the quacks law at the last meeting of the legislature. This law would build and equip all the hospitals in the State, is an utter failure, and for the following reasons: and one-tenth of that amount would cover the cost First, it did not contemplate the prevention of quack- of maintaining these hospitals. One fifth of the ery within the State, because it was not intended money annually filched from our people by these that it should interfere with the nefarious business of charlatans would maintain a large free hospital in the quacks already here. Second, because all man-every town in the State having a population of 5,000 ner of men have been allowed to register under the or over. The money of which the citizens of Michlaw. We find that not only druggists and others igan are annually despoiled by these wily quacks who had not been heretofore engaged in practice, would pay the yearly salary of all the teachers and but still others, who thought they might desire to professors in our public schools, normal school, agripractice medicine at some time in the future, have cultural college and our State University. One half enrolled themselves, and in the eyes of our farcical the money of which the people are yearly robbed. law they are your equals. Third, the law is a failure because our legislators have failed to give them probecause it has not been enforced, except in a single tection from a horde of swindling mountebanks, instance. To-day the people of Michigan are as would more than pay the salaries of all the clergyfully at the mercy of the relentless charlatan as they men in the State. were a quarter of a century ago.

lation of the State has increased nearly one million. Michigan, within that time. To reduce the matter to a mathematical calculation, let us suppose that the average physicians will say, it is none of our business; if the amount of money which each of these swindling people are willing to be swindled by these fellows, it quacks succeeded in filching from his dupes was matters not to us; if the people will not avoid these \$2,500 per annum. By many this will be considered mountebanks, let the people suffer for it; if the peotoo small an estimate, for many of them spent money ple cannot choose between properly educated physilavishly in advertising their business. Now, multi-cians and those who are mere pretenders, they should ply the \$2,500—the sum which each obtained—by bear the consequences; if the people will not learn 3,000—the number of quacks forced to leave the to avoid the charlatans who put forth glittering ad-State—and we get the sum of \$7,500,000 which has vertisements, and who try to dupe them by all manbeen saved in one year. Let us again multiply this ner of false promises, they, the people, should pay by nine—the number of years the law has been in the penalty. I well remember hearing one physician operation—and we find that \$67,500,000 have been say: "So and-so's advertisement sends me many pasaved the people of Illinois by the passage of this tients who would not think of consulting a doctor law regulating medical practice within the State.

State. The population of Michigan is equal to one- philanthropic spirit, and they show such physicians half that of Illinois. Upon that basis we have 1,500, to be unworthy their noble calling. quacks in this State. Indeed, it is probable that the . The business of most physicians is unaffected by number is considerably greater. There are at least the presence of the charlatan, because the victims of t,500 men and women in Michigan who pretend to the latter are largely those upon whose imagination be physicians, but who have no qualifications for the and credulity he can play. One of the princes of profession which they pretend to practice. Upon this class of swindlers held forth in this city not long

preventable diseases. So, also, our Board of Health, and adventurers," has done an invaluable service to our city, not the least of which has been the instruction of our citizens regarding the importance of sanitary measures, and the best means of limiting the spread of contagious

Who will say, then, that the medical profession, as a whole, not only those of the regular school, but also the homoeopathic brethren, should not unite as one hody of teachers, to instruct the people of this State regarding the importance of a law which, in EMERITUS PROFESSOR OF PRINCIPLES AND PRACTICE OF MEDICINE IN the words of Gov. Hamilton, "will protect the lives, the health, the morals and the property of the people of the State.' I maintain it is the duty of the medical profession to point out to the people the dangers which surround them. I maintain it is the bounden duty of every true physician to use the power that in him lies, to alleviate the sufferings and right the wrongs, protect the lives, the health, the morals and the property of his fellow beings, and to warn the community in time of danger. I believe. that this, the largest local society in the State, could render valuable assistance in bringing about a much of them the acute stage had been well marked, and needed reform in medical practice in Michigan. If the chronic condition seemed to be only delayed the Detroit Medical and Library Association would take the first step in enlightening the public, I think other medical societies would follow their example,

We should have a law prohibiting all non-graduates of respectable colleges from practicing medicine until they had passed a satisfactory examination before a State board of examiners, similarly constituted to the State board of examiners in pharmacy. After the enactment of such a law, no man, whether a graduate in medicine or not, should be allowed to commence the practice of medicine in the State until he had passed a satisfactory examination before the State board of examiners. Such a law is in force in Virginia, Mississippi, and other States, and it works well. Such a law tends to make medical colleges men. For my part, I would like to see a law in Michigan which would compel all candidates for a medical degree to go before a State board of examthe medical colleges in the State.

It may be difficult, it may even be impossible, for us to enact in this State a law which will afford the case. people all the projection to which they are entitled. but if we can arouse public sentiment upon this ques-

A CASE OF CHRONIC PSEUDO-MEMBRANOUS BRONCHITIS.1

BY It. A. JOHNSON, M.D., L.L.D.,

Pseudo-membranous bronchitis is rarely met with. In making this statement I exclude the persistence of a diphtheritic bronchitis and croupous pneumonia, in both of which diseases the expulsion of false membranes may occur. It is, perhaps, not always easy to make an absolutely correct differential diagnosis of these cases. This difficulty rests upon the fact that (1) membranous inflammation of the bronchii of an acute character, such as diphtheria, may become chronic. I have seen several such cases, but in all convalesence. (2) Croupous pneumonia may certainly become chronic, but so far as my own experience enables me to judge, the membranous exudate, if present, disappears with the acute stage.

The literature of the subject is quite voluminous in titles, as may be seen by reference to the index catalogue of the library of the Surgeon-General's office, but the number of cases is small.

Among the cases reported in our own country, one by Dr. W. C. Glasgow, of St. Louis, in a paper read before the American Medical Association for the year 1879, is especially noticeable. In this article the author embodies the experience of several of the more prominent physicians of the United States.

Dr. Richardson, of New Orleans, "in a practice more careful in regard to graduating incompetent of nearly a third of a century " had "never encountcred a case of plastic bronchitis."

Dr. Geddings, of Aiken, South Carolina, had ' never met with a case." It should be remembered iners, which board should be entirely independent of that Dr. Geddings had a very large experience in lung troubles.

These, in addition to the case reported by Dr. Glasgow, comprise all the titles 1 am able to find in the United States and Canada. They evidently include also some of the cases referred to in the correspondence reported by Dr. Glasgow and briefly summarized above. In some of these cases it seems Dr. R. H. Fitz, of Boston, had seen four specimens to me there was simply an acute or diphtheritic inof easts. Does not seem to have seen the patients, flammation running its course in a few days and terminating in death, with such symptoms as are seen Dr. Geo. P. Andrews of Detroit, had never seen in the ordinary forms of diphtheritic inflammation.

Among foreign authorities the reports are also Dr. Roberts Bartholow had seen one well-marked meager. Eichhorst, in the last German edition of his work on special pathology and therapeutics, finds Dr. J. R. Leaming, of New York, had seen, in only 100 cases on record. The article in Ziemssen's Encylopedia gives a very clear statement of what is known as to the etiology and pathology of the affec-Dr. Gleitzman, of Ashville, North Carolina, had tion. Among other writers Cheyne thinks old age en one case.

predisposing; Valleix doubts this. Gintrae says that Dr. J. M. Da Costa, of Philadelphia, had specimens the larger number of cases are observed in adult life. the bronchii, this is true.

The male sex is predisposed to the affection according to most authorities. Enfeebled health from Dr. P. E. Robinson, of St. Louis, reported one previous disease, poverty, fatigue, exposure, are among the most common causes noted. Of course all these are so many synonyms for ignorance. The Dr. Samuel G. Armor, of Brooklyn, had seen "a cause remains to be discovered. It may be some local colony of parasites. The relation of this dis-Dr. Frank Donaldson, of Baltimore, had seen one ease to the ordinary forms of membranous inflammation in some of which bacteria are believed to be a pathogenic factor suggests this, and perhaps makes it probable.

The relations to antecedent disease are by no means constant; neither diphtheria, nor simple bronchitis, nor pneumonia, except in rare instances, eventuate in chronic pseudo-membranous inflammation of the bronchial tubes. Rugel says, "a special fession in America. I am, however, inclined to think predisposition, or the influence of some special unknown agency is always essential in addition" to the

last three days because of this pain.

Upon examination find the motions of the lower change with change of position; breath sounds indistinct, voice sounds exaggerated. Friction sounds of Lord Bacon, 'medicus natura' minister et interpres.'" distinctly heard over anterior portion of chest when patient lying on back; less so when patient is sitting last few weeks, I have seen the patient, and find him up. Diagnosed, pleurisy, question of effusion doubtful; a hypodermic needle was introduced with negative results. Chest was ordered to be painted with iodine. The turpentine was continued.

Dr. Frank S. Johnson, to whom I am indebted for the larger portion of these notes, had made this visit, and on his return from the patient, in the extreme northwestern part of the city, became seriously ill. I was unable to look after the patient, and I asked my friend, Dr. S. D. Jacobson, to take charge of the case. This was, I think, on the 5th of February, 1885.

I beg to add extracts from a letter from Dr. Jacobson, giving in a general way the further treatment of the case:

"As to my ideas about the therapeutics of this case I can be short. I am not troubled with an émbarras de richesse, but rather find my excuse in the old saw, simplex sigillum veri.

"The case was to me one of great interest, having never seen a similar one in twenty-five years of practice, and finding little or no mention of such cases in the books at my disposal. True, I have had one case of bronchial croup, which terminated fatally in a couple of days (a man about 48 years old). But your case had already been under your care and observation for several months before I saw him.

"During the earlier months of my attendance he was about the same as when you saw him, intensely harassing cough with dyspacea until relieved by the expulsion of greater or smaller masses of bronchial casts, which relief was generally paid for by severe hæmorrhages, which told on the little strength he possessed before, so that he not only dwindled down to a skeleton like appearance, but when able to sit up his legs would not support him, and his hands grew so weak that he could not for some time lift the spoon to his mouth. During the summer of 1885, he improved some, but the fall and winter reduced him below his former level.

"Having no authorities to guide me in the treatment of such a rare case, I applied the general principles to the best of my abilities. I had two indications before me, (1) indicatio symptomatica, and (2) indicatio morbi. As to the first class, I had in Priest. view the cough, dyspnæa, hæmorrhages, weakening of all the organs and functions. Those I tried to meet by the exhibition of solventia, expectorantia, narcotica, styptica et roborantia. As to the indicatio morbi I was more in the dark, knowing almost nothing about the pathology or etiology of this disease.

continues to cough sputum streaked with blood, and But I reasoned like this: Since our pathology seems occasionally very slight epistaxis. Is still taking the to drift more and more into bacteriology, it is but turpentine; thinks the cough is looser than when just that our therapeutics follow suit and be more in taking the iron. During the past week has had a the nature of bactericides and antiseptics. In this good deal of pain, intermittent in character, in the light I wish you to judge my prescriptions containing lower half of the right chest; has been in bed for such poisons as arsenic, iodine, bi-chloride hydrarg. and iodoform, which appear in many of them.

"I must confess that my success was a great deal right side restricted; on percussion, dulness over the more than 1 dared hope for, and though 1 firmly lower third of right lung, line of dulness seems to believe in the vis medicatrix natura, I also believe that a physician can be, and should be in the words

THE PROFESSION AND PRACTICE OF MEDICINE

In Some of Its Relations to Human Society.

BY S. M. HAMILTON, M.D.,

OF MONMOUTH, ILL.

This is a subject of great width, in its entirety. The history of medicine may be very appropriately included in the investigation, as well as an almost interminable biographical account of its representative members. But at present we will only try to give a few suggestions: first, as to the mutual relations between the profession of medicine, as a profession, and the public; second, as to the true status of the individuals who pretend to practice it.

The healing art, as it is sometimes called, is so old that no one can tell when it originated. It is quite probable that, with the exception of the priestly office, and those occupations and professions growing directly out of man's physical wants, it is the most ancient of all. I cannot tell whether it was from the first a part of the priestly office to minister to the ilisof the body as well as the soul. But it is a fact that what we call the "historical era" found the profession and practice of medicine wholly in the hands of the priests. The Mosaic Law sets it down as a part of the priestly office, and the cure of disease through religious rites and ceremonies is a part of the Jewish creed. These rites and ceremonies, we are expected to believe, and do believe, were conditions to cure, enjoined by the Almighty. But curiously enough, coupled with them in all cases are certain things which the afflicted person must do for himself, to secure the result desired. There are instances, to be sure, of miraculous cure of disease, where the means employed seem to have no rational connection with the result. But, as a rule, there is laid down to the patient a set of rational sanitary laws, which he must observe just as rigidly as the religious rites of the

The rite of circumcision was instituted as a sanitary necessity, beyond doubt; and it was made a part of the religious code of the Jews, merely to insure its observance. The evidence is conclusive that venereal and syphilitic disease existed to a prodigious

It has been compared to their duties.

We must be missionaries, devoted to the cause, until this heathenish darkness is dispelled, and this heathenish practice driven from our fair land. Above; all, let us all do our best to educate the head and the heart of that fairest and most lovely of all God's creatures, the American girl, so that she may avoid this soul destroying crime against God and her own flesh and blood.

NOVEL METHODS OF TREATING DISEASES OF THE MIDDLE EAR.1

BY SETH S. BISHOP, M.D.,

OF CHICAGO.

ATTENDING SURGEON TO THE ILLINOIS CHARLLABLE EYE AND EAR IN-FIRMARY AND TO THE SOUTH SIDE FREE DISPENSARY, ETC

In diseases of the middle ear, attended with increased and perverted secretions, the surgeon often feels the need of methods more effectual than the old ones for evacuating this cavity. Serum and mucus may be absorbed if they are not too abundant, but in frequently recurring attacks of sub-acute inflammation, such as occur in persons subject to nasopharyngeal catarrh, nervous coryza, etc., the secretions are so profuse and attacks follow each other in such rapid succession, at certain seasons, that the middle ears contain mucus for periods of considerable length. Absorption may not occur after one attack before another supervenes. Unless these secretions can be removed, progress toward recovery is impeded, and the hearing is seriously impaired.

Instead of relying solely on the old methods of evacuation by injections into the middle ear, paracentesis of the membrana tympani and inflation, I have employed a treatment so simple that patients may practice it unaided. I have never seen such a method published, but I believe that its beneficial effects in a large class of cases entitle it to a place in aural therapeutics. This method is the reverse of the Valsalvian experiment. The patient closes the mouth and nostrils and exhausts the air in the nasopharynx by a strong inspiratory act. This causes the ejection of the column of air and the secretions from the Eustachian tube and tympanum into the pharynx. The success of this practice becomes apparent in several ways. On evacuating the middle ear one experiences at first the subjective sound of rushing air, followed by the sensation of a movement inward of the drum head and ossicula. These sensations are accompanied with crackling sounds, comparable to fine mucous râles. After the discharge has entered the throat it may be seen on inspection with the rhinoscopic mirror, and sometimes without

a metallic taste, when I have found a mixture of mu-We cannot dodge our responsibilities in this mat- cus and pus escaping from the tube. After removing the discharge the patient is directed to swallow, or practice the Valsalvian experiment, whereupon the air re-enters the middle car and restores the equilibrium of atmospheric pressure on both sides of the drum head. A sense of relief from pressure, and increased hearing distance, follow. One should not inflate the middle ear too soon after practicing this method, else the tube and tympanum may not be emptied completely, and the entrance of air through the tube may force some remaining fluids back into the tympanic cavity, where they will be retained until the next treatment. That the discharge does not emanate from the nasal cavities is apparent from the rhinoscopic examination, and from the fact that it occurs when there is no concomitant haso pharyngeal catarrh, and the peculiar taste is experienced only after each evacuation of the ear. When the contents of the tympanum are of too great consistence, or too tenacious, to pass readily through the tube, we may liquefy them by injections of warm water solutions of salt or soda, so as to render their expulsion possible.

There are cases in which this method is impracticable owing to resistance in the tube. Its walls may participate in the tympanic inflammation and become so swelled as to close the passage into the middle ear, or the walls of the tube may be agglutinated together by adhesive secretions. Yet after ineffectual attempts, success has often rewarded repeated efforts, and a threatened rupture of the membrana tympani has been averted. A short, spasmodic effort may not suffice, when an inspiratory act, prolonged for the space of five or ten seconds, may succeed. If it does not, the surgeon may diminish the resistance to the passage of air through the tube by the use of astringent Eustachian bougies, or washes, when the occlusion is due to swelling of the walls. When the stoppage is attributable to the presence of secretions, the following method may be resorted to: A vulcanite syringe may be introduced into the Eustachian catheter in situ. Gentle traction may be exerted with the piston rod so as to suck the contents of the tube into the catheter. By this means the tympanic cavity, as well as the tube, may be emptied. The curve of the distal extremity of the catheter should be so adjusted that the axis of the beak shall correspond to that of the tube. Otherwise the part of the tube impinged upon might be drawn into the opening of the catheter, which would prevent the escape of fluids and occasion some irritation. The syringe should be easily manageable with the thumb and fingers of one hand, and the piston should fit the cylinder perfectly, to insure success. A Politzer air balloon, without a valve, may be substituted for the syringe. The air bag, exhausted by compression,

¹ Read at the Annual Meeting of the Illinois State Medical Society.

ance in the tube has been overcome by this means certains the degree of its mobility. the more simple method will probably succeed.

the middle ear with proliferation of the mucous tisand the ossicles partial anchylosis in the chain of bones and retraction of the membrane. By repeatedly alternating this method with the Valsalvian or the Politzer method of inflation, the air is alternately rarefied and condensed in the middle ear. The effect of this practice is to cause, by rarefaction, a movement inward of the drum head and motion in the articulations of the ossicles with each other, and evident that by this means the bands of adhesion are stretched, and perhaps divided, and stiffness of the joints is prevented or modified. I employ this treatment on the principle that motion prevents or overcomes anchylosis, as one sees demonstrated frequently in general surgery. It has an advantage over other methods in that patients are able to practice it unaided by a surgeon, and catheterism can be omitted. These are important considerations in the treatment of sensitive and fastidious or indigent patients. If they are unable to inflate the middle ear ing distance rapidly increase when no other treatment. than this passive motion was employed. It is apparent that as the freedom of motion is restored in the sound-conducting apparatus it becomes possible for it to respond to sound waves, to the vibrations of which it was not before susceptible.

When this method is not successful, on account of an impermeable tube, I have resorted to another

cine, No. 42, 1886.

Treatment of Prolapsus Ani in Infants.—Dr. BETZ. of Heilbronn, relates in the Memorabilien, 1886, Heft 4, the case of an infant five months old which had been afflicted with prolapsus ani for five weeks. Cold water enemata, ice suppositories, dusting with pulverized alum, tannin locally and internally, opium, bromide potassium, and even injections of ergotine had been employed without benefit. The little patient was in a deplorable condition, greatly emaciated, covered with large and small boils, and intertrigo; it was incessantly straining and crying. The prolapsed bowel was a livid, conical plug, 512 cm. in length; it was readily reduced, but pressure being removed it was shot out again by the straining of the child. Profiting by a knowledge of the treatment previously used, he at once determined to resort to nitrate of silver applications, but as the application of the stick caustic always acts unequally on the mucous membrane, and may result in ulceration, he made a solution of argent, nitr. 1.0, sulphuric ether 5.0, alcohol 25.0. This solution, though it AULT, of Paris (L'Abeille Med.), has often employed gives rise to some smarting, can be evenly and equally applied and enters the tissues to a considerable depth. The prolapsus was thoroughly painted with the above solution, and even after a few minutes it became paler, began to shrink, and could be reduced more readily. To act on the upper portion of the mucous membrane a small piece of alum was introduced high up into the rectum. To prevent the bowel from slipping down, and to exert continued pressure on the anus, the nates were firmly pressed together and held in this condition by three broad strips of adhesive plaster, which were applied on either side, running from the anterior surface of a thigh across the seat to the opposite anterior surface of the abdomen. The next object was to stop the come on after a short time, and resorting to it early tenesmus and to prevent defecation, which was accomplished by keeping the child slightly under the narcotic influence of opium, and restricting its diet to small quantities of milk and water. The tenes-; mus stopped at once, and flatus was freely passed in twenty four hours. The dressing was reapplied after Betz, though he is inclined to attribute much of sults. - Lancet, Nov. 20, 1886.

Dr. Chantemesse has used this method at the St. the rapid success to the application of nitrate of sil-Antome Hospital for three months, with the follow- ver, claims that the combined treatment carried out ing results: Attacks of asthma cured by injections by him is entitled to the credit for the same, and of carbonic acid gas charged with sulpho-carbonated would in a similar severe case not do without the vapors. In some of these cases the effect was quickly adhesive dressing, the opium, the restricted diet and seen during an asthmatic attack. Pulmonary tuber- the alum suppository, in addition to the nitrate of culosis was treated with the same mixture, and with silver application, while in a milder case nitrate of excellent results.-Bulletin de l'Académie de Mède- silver, opium and restricted diet would be sufficient for a cure. No relapse occurred.

> Regeneration of the Spleen after Extirpa-TION.—A. ETERNOD reports an experimental case on a fox, four months old, from which the whole spleen was removed. It died 161 days after the operation, and the autopsy showed the following peculiarities: 1. Partial regeneration of the spleen, consisting in the new-formation of a splenic nodule, having anatomical connection entirely different from those which supernumerary spleens have under ordinary circumstances. 2. A new formation of ordinary tissue in the ganglia and Peyers's patches, in the adipose tissue of the mesentery, and even in the hepatic lobules. Transformation of the ganglionic parenchyma, old and new, in the splenic parenchyma. 4. Diminution in the quantity of the blood. 5. Increase of the adipose of the mesentery. These results agree, in a general way, with those obtained by Tizzoni, Griffini, and others in experiments on the dog.-Revue. des Sciences Med., July, 1886.

> To Break Up a Hysterical Paroxysm.—Rufirm and continuous compression of some superficial nerve. The supra orbital nerve is especially adapted for this purpose. The patient's head being firmly held between the hands of the physician, he places his thumbs on the inscisura supra orbitalis and makes gradually increasing pressure. The effect is said to be as follows: The patient begins to contract her facial muscles as if in pain, gives vent to short screams, makes four or five short inspirations, the thorax remains fixed in inspiration, the dorsal and nuchal muscles contract to hyperextension of the spine. Now a deep expiration takes place, the muscles relax, the paroxysm is over. The pressure may have to be repeated, as a new paroxysm may may intercept the attack. The sooner the paroxysm comes under treatment the more rapidly will it be broken up by the maneuvre. - Memorabilien, Heft 2, 1886.

NEW OPERATION FOR PROLAPSUS UTERL.—A Mextwo days. No prolapse occurred. The anus was ican medical journal gives an account of an operacleansed with a wad of cotton steeped in carbolized tion practiced by Dr. Malanco for the purpose of oil, five per cent., and a piece of alum was again forming a kind of false uterine ligament in cases of inserted. The anus was found drawn into folds and prolapsus. It consists in passing a trocar from the contracted. After three days a new dressing was anterior vaginal fornix to the abdominal wall (taking necessary. The gut being slightly prolapsed, was care, of course, to avoid the bladder), and in applytreated with the stick caustic. Two days later the ing the actual cautery to the track by means of a dressing was permanently removed. Stools came thermo cautery inserted through the canula from the on without tenesmus. In order to insure contraction front. The proceeding, which was first proposed by of the anus, he ordered it touched with alcohol for Dr. Fenelon, of Mexico, is stated to have been ema few days. The cure was completed in eight days, ployed several times with the most successful reTHE

A NEW TREATMENT OF FEVERS.

treatment of fevers, and he does this in accordance with our as possible." new grounds which are "more in accord with our have considerable toxicity.

though wrongly, for a long time that the production Journal of the American Medical Association, of heat is subordinated to organic oxydation. But it it is now known that oxydation is not the exclusive source of animal heat and of febrile pyrexia; and it is also known that disassimilation is accomplished by the successive acts of which the first are hydrations and chemical combinations, which give rise to products which are only secondarily overcome by oxy dation, and that animal heat results from the ensemble of all these reactions. And in typhoid fever, as the acts of oxydation are decreased the part played by oxydation in febrile pyrexia should be proportionally reduced. Now, in reality, the coefficient of oxydation is less in typhoid fever than in the phlegmasiæ, and even less than in the normal state, since it is not above 74 per 100, while physiologically it is 85 per 100. Again, the proportion of urea is in inverse ratio to the gravity of the disease; and, thirdly, the excretion of carbonic acid of the typhoid fever patient is to that of the healthy man as 83, 8:100. It is M. Albert Rofan, who so admirably combines a therefore vain to attempt to restrain oxydation so as thorough knowledge of physiological chemistry with to lower temperature, since this would be assisting medical learning, has just published, in the Gazette the disease. The aim of therapeutics in these cases Médicale de Paris, of December 25, what he calls "A should be to regulate organic disintegration, and thus New Therapeutic Method; or the Oxydizing Method to favor oxydations instead of hydrations and chemin the Treatment of Fevers, and particularly of ical combinations, so that the products of tissue Typhoid Fever." The answer we will try to give next week, incubating temperature. In filtered river water the micro-organisms become multiplied at 20° C, with RESPONSIBILITY OF MEDICAL MEN IN REPORT, much greater rapidity than those in unfiltered water; and the organisms in deep well-water manifest but Many months since much interest was excited in little tendency to multiply in the cold, but at 20° C.

their multiplication is in excess of anything observed with river waters.

With regard to these results Dr. Frankland says: "These tables show the enormous capacity for multiplication which is possessed by the micro-organisms present in this deep well water. This is the more surprising, at first sight, when it is borne in mind that this water contains the merest trace of organic mat-It must, however, be remembered that this water is at the outset almost wholly free from micro organisms, and that it has never before been inhabited by such living matters; it is only reasonable to infer, therefore, that those of its ingredients which are capable of nourishing the particular micro-organisms which flourish in it are wholly untouched, whilst in the case of the river waters the most available foodsupply must have been largely explored by the gen erations of micro-organisms which have inhabited them."

We thus have an explanation of those cases in which infectious diseases are disseminated by wellwater, examples of which, especially in the case of typhoid fever, are abundant. Dr. Frankland points out that the original source of the micro organisms gations are estimated.

CHARLES JAMES Fox, M.D., of Willimantic, Conn., has been appointed Surgeon-General of the State of Connecticut, and entered upon his duties as a member of Governor Loundsbury's staff on the 7th inst. and intelligent members of the profession in his with general bronchitis. At first I supposed it was State.

SEPARATING THE INCURABLE INSANE FROM RE-CENT CASES.—The desirability of doing this has been clearly pointed out by professional writers, and we are glad to learn that the importance of the subject received attention by Gov. Thayer, of Nebraska, in his recent inaugural address.

THE SACRAMENTO MEDICAL TIMES IS the title of a new monthly journal, the first number of which will appear in March, under the editorship of James 11. Parkinson, L.R.C.S., and Wallace A. Briggs, M.D., of Sacramento, Cal.

RETEREMENT OF PROFESSOR PAJOT.—Prof. Pajot, of the Paris Faculté de Médicine, recently attained his seventic'h birthday, the time at which all Professors in French institutions must retire.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, December 20, 1886. THE PRESIDENT, EDMUND J. DOERING, M.D., IN THE CHAIR.

Dr. Hosmer A. Johnson read a paper on PSEUDO MEMBRANOLS BRONCHITIS.

(See p. 60.)

Dr. N. S. Davis said: The disease which has been reported in the paper is one of rare occurrence. Having had occasion within the last two years to hunt up the literature on the subject, I found nothing more than has been stated in the paper, but I have no doubt that the disease is of more frequent occurrence than the reported cases would indicate. It is not always readily recognized, the question of diagnosis is not pursued with such closeness that the practitioner identifies it clearly, or gives it sufficient attention to recognize that it belongs to a rare form of bronchitis, and consequently the case is treated until the patient is well, or dead, and no record is made of it. In my own practice I think I have recognized at least four or five cases, and I remember some of them perfectly well, and the facts connected with should be regarded before the value of such investi- them. I think the disease is more frequently met with in a chronic than in an acute form. The case that has just been detailed would come under the former class. In the majority of cases the disease attacks only a limited portion of the bronchial distribution. The cases that have been met with in an acute form, covering the greater part of the bronchial distribution, have been almost uniformly fatal.

The last case of this character that I treated was It is a deserved compliment to one of the most active a young woman, a servant girl, who was attacked only a severe catarrhal bronchitis, but it created a cough unusually suffocating. There was but little expectoration for the first two days, subsequent to that she began to get, in the paroxysms of coughing, a little viscid, frothy mucus and several times a day there came mingled with it well defined shreds of a membranous character. The patient belonged to a family that had marks of some specific influence of an hereditary character. In the progress of the case, during its acute stage, there were no complete casts, but shreds sometimes an inch and a half long, as though they were torn loose and thrown off. In the later stages the membranous discharges ceased and there was a suppurative condition. She expectorated a copious purnlent matter as in ordinary cases of tuberculosis, but there were no cavities of the lungs, and the structure gave no evidence of having been invaded. She finally became exhausted and died. I have seen one other case that I regarded as an acute attack of this character; a child between 7 and 10 years old. That also ran an acute course, and the patient died from suffocation from the persistent obstruction. The other cases that I have seen have been of the chronic character and apparently involved

only a portion of the air passages. They would have look upon it as a case of pseudo-membranous bronattacks accompanied by feverishness and soreness chitis, and I questioned in my own mind when conwhich would go on to suffocating, violent paroxysms, templating, the subject, whether in the true plastic of cough, and in the midst of the cough would dis- exudation that persistently forms, dislodges, re-forms charge more or less of the exudation. One case and keeps on doing so, if the patients were put upon ended in the development of what has been called of full doses of such remedies as salicylate of sodium or late years fibroid phthisis. I followed with good results and ultimate recovery.

made a fair recovery. The character of the cough and their description of the expectoration led me to 1 Vol. iv. fasc. 4, 1872

Dr. Robert Barcock said. The paper is one of the patient died exhausted. The record of statistics the most interesting I have listened to. It is needshows that a large majority are of a partial character, less for me to say, since such a man as Dr. Johnson involving but a limited portion of the bronchial sur- has seen but one case, and such a man as Dr. Bowface, and these, though obstinate and apparently diffi-ditch has never seen a case, that I have never seen cult to relieve, usually recover. I think that it is one. In regard to the etiology, I would merely state stated, also, that there is more than an ordinary tend-that R. Douglass Powell says this form of bronchitis will find in the fibrillated material some scant parti-cles of fat granules and here and there a leucocyte, otic condition of the blood. The line of treatment and when expectorated there is frequently an exida- pursued by Dr. Johnson is interesting with regard to tion of blood, but I think not often the amount re- this point; after giving iodide of potassium and the ported in this case. I recollect very little, if any, mercurial salt in pretty full doses the character of blood following the expectoration of membrane in the expectoration changed, becoming mucus and the cases I have had an opportunity of observing, frothy, and it was not until these remedies had been Each layer of membrane tends to disintegrate, and given up and syrup of iron substituted that the plaswhen one has been thrown off another follows it, and tic character of the bronchitis reasserted itself. May this goes on, in the chronic form, indefinitely, unless it not be that the exhibition of the potassium iodide there is a change of condition. In these cases, as in and the mercurial salt did overcome to a certain exall true plastic exudations, there is some condition of tent the hyperinosis which may have existed in this

Dr. S. D. Jacobson: It has been my good for-In regard to the treatment, I have nothing specially tune to see, besides this instance of the chronic form, new to offer. I found that the chronic form was most which I saw through the courtesy of Dr. Johnson, benefited by ordinary anodyne expectorants com- one case which represented the acute form of this bined with alteratives, especially of the mercurial disease. It was a friend of mine, a man of about 47 In two instances of the chronic form the years of age, who was accustomed to take great steady use of the alterative mercurial influence until quantities of alcoholic stimulants. In the winter of inspected his pharynx and found a condition such as I remember one instance, I cannot say positively might be expected from a man who was out of doors that it was of the true pseudo-membranous character, a great deal, who was an inveterate smoker and a of a man whom I was called to see and who subse very convivial man. There were no symptoms of quently came to my office. He had an attack of the diphtheria; it was a case of pharyngitis or tonsillitis. subacute character, involving apparently the whole. Under the usual treatment it improved in a couple of of one bronchial distribution, which produced a very days. About a week after he sent for me, and I persistent and distressing cough with apparent suffo-found him with some fever and a very distressing cation. The man and his wife averred that in his cough. He expectorated great masses of mucus, and coughing he threw off long pieces of a membranous. I recognized them as casts of bronchial tubes of the substance several times, but as it was never saved I first and second order. At that time I had never had no opportunity of examining it. In this case heard of such a case. The next day I found him in there was a well developed rheumatic diathesis, and great distress, and after a long and tiresome cough he I looked upon it as partaking somewhat of the nature brought up numerous quantities of matter like the of rheumatic bronchitis associated with plastic exuda- first casts I had observed, which I found to be of the tion. I put the man upon salicylate of sodium, dose third and fourth order of bronchial casts, and after 10 to 15 grains, accompanied at first by ordinary anothat he felt relieved, but died on the third day afterdyne expectorants to help allay the severity of the ward. I then saw a report in the Scandinavian Medcough. It acted favorably, and not only his bronchi- ical Archive describing a case exactly similar to tis but his rheumatic troubles disappeared, and he mine, except that the man was 34 years of age. On

were rather given to alcoholic stimulants.

Dr. E. Fletcher Ingals said: I have had very little experience in these cases. It has never been my bad fortune to meet with a case of acute diphthe ritic bronchitis except those growing out of ordinary recovered.

lady's case was one of acute croupous bronchitis.

post-mortem it was found by incising the chest that there were no casts thrown off. Some time before it contained air over both lungs, and the bronchial that the patient had been taking potassium and mertubes of the first, second and third order all con- curial salts. In estimating the frequency of this distained casts. The lung contained air mixed with ease I have excluded cases which seemed to be of mucus and pus. The trachea contained casts which diphtheritic origin. I have seen several cases where terminated on the under surface of the epiglottis, there have been well marked casts thrown off; in The physician questioned whether it was an ascend- one case there were seven successive discharges ing bronchitis or a descending fibrinous exudation from the bronchi ramifications of one lung. Those from the pharynx downwards, because in this case, were diphtheritic and were from a child who was reas in my own, there had been tonsillitis about a week covering from bronchial diphtheria. I do not say before the alarming symptoms set in, but arrives at that this is not in its character anything like diphthe conclusion that the disease was primary in the theria, but I think there is a radical difference in the bronchial tubes. I have thus been fortunate enough membrane and that which forms in diphtheria. It to observe this rare disease in two cases, one repre does not seem to me that we have the same tendency senting the chronic, the other the acute form, and to disintegration that we have in diphtheritic forms both of them conforming to the rule laid down by of exudation, the exudate is more plastic. I have Dr. Davis, that the acute generally terminates fatally, purposly not discussed the acute form as I have not while the chronic in many cases terminates favorably, had an opportunity to study such cases. The notes Both of my cases were of the male sex, and both were made in the presence of the patient and they seemed to me worthy to be put on record.

Dr. H. A. Johnson read a paper on

PNEUMATIC DIFFERENTIATION AND MEDICATION.

The question of pneumatic differentiation has been diphtheria, which are infortunately frequent. I have quite largly discussed by members of the medical treated three cases of the chronic form of the disease, profession during the last two or three years, but none of them very severe. In each case there was there seems still to be a good deal of mystification from time to time expectoration of the croupous de- on the subject. I was unable to be present when posit, but I did not see them at any time when they the matter was brought before this society. I therewere very ill. The history of the chronic cases is fore beg permission to say a few words which I had that that they will have acute attacks from time to intended to say at that time and also to exhibit a time for months or years, running from ten days to contrivance for medication by spray or vapor in contwo weeks. They almost universally recover from densed air. It is not my purpose to discuss the these, though occasionally they die of phthisis. The merits of pneumatic differentiation. The subject, acute cases, as a rule, die, though from 25 to 50 per if not the term, has been before the profession for cent, are said to recover. A friend in the country many years, and various devices have been employed sent me last winter casts from a large number of the in its accomplishment. The manufacturers of pneubronchial tubes. I should say there must have been matic cabinets insist that the desired results can be five or six branches to these casts. They had been realized only by placing a patient in a box with a coughed up by a patient of his who subsequently tube, by means of which he breathes the air of the room, while the pressure on the surface of the body Dr. C. M. Firch said: Some eight years ago 1 is either diminished or increased by pumping air out had a case of this kind in a lady about to be con- of the box or into it. It is claimed that the result fined. When I first saw her she was in an almost upon the body must be quite different from that comatose condition, the face livid, and she was al- reached by the use of the Waldenburg apparatus or most pulseless, the respiration fearfully obstructed, other similar devices, for the reason that in some although air was entering all the larger bronchi. The way the movement of a body under the pressure of woman died a few hours later, the child being born a force, we will say, of fourteen pounds against a reafter she had become entirely unconscious. Four or sistance of thirteen pounds, in which the available five days later a child of the same family was taken moving force is one pound, must be quite a different with diphtheritic croup, the membrane passing down process from that which is reached when the moving through the larynx, when Dr. Fenger performed the force is fifteen pounds and the resisting force fouroperation of tracheotomy. I have no doubt that teen pounds. They do not, it is true, state it in this form, but they do assert that, in case we will say of DR. H. A. JOHNSON, in closing the discussion, said: the patient breathing through a tube the external air In reply to Dr. Babcock as to the influence of the while the air in the chamber has been partly expotassium and mercurial salts upon the exudate, not hausted, so that its pressure is one pound per square only was the expectoration frothy, but after using inch less than the outside air, a vis a fronte is dethese medicines for some time the casts became thin veloped, by which the fluids and gases of the body and evidently diminished in amount before they are moved in a manner quite different from that were thrown eff. It was my opinion that the mer- which takes place when the patient sitting in the curial salts and the potassium had some influence in room breathes from a tank air compressed so that the diminishing the amount of the exudate. You will pressure of the air breathed is one pound per square remember, some time in December until February inch greater than that of the air in contact with the

surface of the body. It must be evident that there pressure in the tank from which my patient breathes.

is a fallacy in this claim. a tergo, which pushes into a partial vacuum sufficient be made of wood. A strong, tight cask or barrel matter to equalize the force, whatever it be, on the even will answer the purpose. The ordinary form of other side, or to produce an equilibrium of force, pneumatic cabinet—the New York cabinet or the ing, is led to conclude that the effects of breathing provide himself with an apparatus just as useful as reduced about the body, is allowed to breathe the air ported by a spring of any desired pressure, or through reversed the breathing tube of the cabinet, placing from the cabinet into outside air. The simpler the the patient on the outside and compressed the air thing, provided it works, the better. The less mysjective experience of the person operated upon, were therapeutical results obtained by the pneumatic cabifound to be identical with those obtained when he net are only such as may be reached equally well by the same degree."

ing upon the same question with results in no sense, the reach of anyone having a tank for condensed air differing from those reached by Dr. Platt. The for the purposing of atomizing or vaporizing medicproposition to conduct medicated sprays into the inal substances, and requires no more skill or knowlalveoli of the lungs by the differentiation of air prese edge in its use than is required to administer sure has been also ably treated by Dr. Platt, but I parcotics, antipyretics or anæsthetics. **do not** desire to consider it in this connection. 1 The use of sprays or vapors with condensed air is than with ordinary air. conveniently accomplished by the use of the cabinet, but this result can be and has been repeatedly my opinion that pneumatic differentiation is essenreached, and just as easily, by other devices.

and stop corks, so that I could maintain any required, done by the inhalation of compressed air.

This tank may be a simple boiler such as is used in We no longer use the phrase, vis a fronte, in the kitchens for heating water for circulation through the sense of an active force when we apply it to such house, say eighty gallons or more, or it may be in phenomena as those which occur in the case of a any other form desired. As the pressure is never vacuum filled by in-rushing matter. It is well known great, not more usually than one-half or at most now that there is an active force from behind, a 215 three fourths of a pound to the square inch, it may In the pneumatic cabinets there is therefore only an. Pine cabinet—may be used as a tank, but it is unother mechanical device for affecting the differentia- necessarily heavy and clumsy and expensive. As I tion produced by the Waldenburg apparatus, and have a Pine cabinet in my office, I use it as a tank, which has repeatedly been produced by breathing with an 8 inch air pump for compressing the air. Λ air from a tank into which it has been condensed by copper or sheet from tank that can be obtained of any some means, such as air pumps, water pressure, etc. plumber at a small fraction of the expense of the I am not alone in holding this opinion. Dr. Isaac cabinet is quite as useful. Any physician who has a Hull Platt in a paper read before the American spray tube and glass vessel with two openings, a wolf Climatological Association at its third annual meet-bottle or even an ordinary wide-mouthed bottle, can condensed air from the cabinet, the patient sitting in the pneumatic cabinet. By the use of a thin way the room, are the same as those produced when the stop cock expiration may be made into a tank of patient, placed in the cabinet and the air pressure compressed or rarefied air, or against a valve supfrom the room. He says: "To put the matter be a narrowed opening, so as to regain force to expel yond a doubt," that is the claim of a special value in the air from the chest. All these methods have been the inclosure of the patient in the cabinet, "I have used to accomplish the same result, as expiration within the cabinet. These two mend others to do so. patients had been seen by Pean, whose opinion was charged against Apostoli.

ter a trial in fibroid tumors, but I have in the use of and I have employed currents varying in strength electricity generally. There are two factors in the from 25 to 250 milliampères. Apostoli's method treatment of fibroids by electrolysis—the chemical should especially be adopted early for the checking and physical and the physiological. How the physic of hemotrhage from the uterine cavity. I cannot ological action of electricity operates is a question, agree entirely with Dr. Belfield's conclusion in regard but the chemical and physical produce their effect to Dr. Apostoli's results as reported in 1884.1 My by the splitting up of compound molecules and the chemical and physical liberation of gases at the poles. Certainly this factor (the chemical and physical) can be measured by the amount of chemical work dones which depends upon the strength of the battery, etc. It seems to me that a current even of 50 milliampère, is rather strong to use in the beginning. I have had quite an extended experience, and I can now call to mind six or eight cases in which even the slightest galvanic current would produce dizziness so that the

as can be judged from the record, cases of mere sub—thick that this method of treatment offers a good deal cases were most positive and decisive. In two of and I should not hesitate to try it myself and recom-

DR. FRANKLIN H. MARTIN, in closing the discussought as to the advisability of operation. In one case, sion, said: I cannot agree with Dr. Byford that this he declined to operate on the ground that the patient method of treating fibroid tumors should be reserved could not survive an operation; in the other he was as a last resort. In careful hands it is entirely free from ready to operate, but the patient declined. Yet both danger, pain, and (except in the last variety of operof these cases of undoubted and extensive myomata ation described this evening) all disagreeable features, were rapidly and greatly improved and the tumors and it should not, therefore, be postponed until less reduced under Apostoli's treatment. But four cases efficient and more objectionable means have been are not enough to justify a generalization, and I hope employed, such as the hypodermic injection of ergot, that Dr. Martin will soon favor the Society with the its administration internally in large quantities, tamresults of the method in his own hands, for we may poning the vagina, cauterization of the uterine mube sure that he will avoid the sole error which can be cous membrane, and innumerable other less efficient means of relief. In my experience with the strong Dr. P. S. Have's said: I have not given this mate current. I have never yet seen an untoward result,

¹ That Dr. Belheld is in error in regard to this point will be made very apparent by the following summary of the cases reported by Dr. Apostoli and reteried to by Dr. Belfield; of cases were reported, 15 of the cases had never borne chalren. Of the remaining 75 cases, where subinvolution of the interns was possible, we find 4 pedinentated subpertioned tunners in which error of diagnosis was not probable. Of the remaining 75 cases, , me sorred from 10 to 21 cm., and the accompanying descriptions of the cases on base no doing in an imprejudiced min I in regard to their being large fits of growths. The full description in detail of the remaining 10 will consince any one who will take pains to peruse them that at the stag are well defined fibroids. This leaves but 25 cases of the q reported in which there are not distinctive characteristics described, which definitely distinguishes them from simple subinvolution of the uterus.

own results have been such as to make me very san-bladder, and to the whole surface of the womb, measguine in regard to the value of strong currents for the uring five inches in length. But the presumptreatment about the abdomen.

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, Thursday, December 2, 1886. The Vice-President, E. E. Montgomery, M.D., IN THE CHAIR.

W. H. H. Gethens, M.D., Secretary.

FIBROID TUMOR OF THE RIGHT LIGAMENT.

Dr. W. Constantine Goodell exhibited for Dr. W. Goodell the right broad ligament containing an enlarged ovary, and close by its side, but distinct from it, a fibroid tumor of the shape and size of the non-gravid womb. The left ovary was also greatly enlarged. It contained a cyst which burst into the cavity of the abdomen while the woman was being examined four days before the operation, which took place in Dr. Goodell's private hospital on June 22, and she recovered promptly. Her symptoms were painful and feeble locomotion, constant ovarian pains, menorrhagia followed by prolonged dribblings: of blood, and a retroversion which could not be rectified on account of the tender and dislocated ovaries. She had been under treatment for several years, and without benefit; but since the operation she had greatly improved.

He also exhibited for Dr. W. Goodell an

INTRA-LIGAMENTOUS OVARIAN CYST,

with the following history: The girl, aged 18, had been growing large for two years, and her health also began to fail, but a tumor was not suspected until weighing thirty-seven pounds. The patient, a young H. Woods, of Pine Grove Mills, Pa. Discovering a year before. The character of the percussion wave cyst, he sent her to Dr. W. Goodell. The operation and the evenness of the belly wall decided a correct so completely that no pedicle was left to tie. He and yellowish. There were no adhesions. The the size of a goose's egg, was also removed. It con- the whole operation completed in thirty six minutes. tained pus, and also was enveloped in the broad lig. It is two weeks to-day since the operation. The ament and had to be shelled out. In spite of the patient is sitting up in a rocking chair. She had no complications, this case recovered promptly. Dr. fever at all a pulse daily growing slower, and felt W. Goodell had had during the past year another well. The cyst was one large cavity containing case of intra-ligamentous cyst of the most formida, several cauliflower vegetations on its inner wall. ble character. The cyst was attached to nearly the The ovary lay intact on its outer wall and the tube whole of the colon, to the small intestines, to the about ten inches in length was drawn out over it.

tion is that it was the right, because nearly the whole of the right ureter, fully ten inches of it, had to be carefully dissected off from the cyst wall and from between the layers of the broad ligament. Many ligatures were used, and very little blood was lost, but the patient died on the table from shock, while the wound was being closed. Before this death, Dr. W. Goodell had had twenty-two successive ovariotomies, all of which recovered, and he has had eight successful cases since, making in all thirty-one cases with but a single death.

Dr. John M. Taylor, upon invitation from the chair, remarked that the first case reported by Dr. Goodell had been originally under his care. He had attended her in labor and nothing abnormal occured in the puerperal period. He had examined her six weeks later, as is his custom, and found nothing wrong. Some months afterwards she had a miscarriage; there was some placental retention, and it was followed by ovarian tenderness and signs of inflammation which gradually increased, the ovaries became enlarged. Nine months after the miscarriage the operation was performed. An interesting question is, When did the tumor begin?

Dr. Montgomery remarked that there was a resemblance between the tumor and one horn of a uterus bicornus. Was there a distinct separation between the uterus and the tumor, or could it have been such a horn?

DR. W. C. GOODELL stated that the tumor was separated from the uterus by an inch. The tumor has greatly diminished in size since it was placed in alcohol.

Dr. Howard A. Kelly exhibited a

PAROVARIAN CYST

six months ago, when she was examined by Dr. Geo. woman, multiparous, had noticed the tumor one was performed on September 25, at his private hos diagnosis. A point of interest was the flatness of pital, and was a difficult one, because most of the the anterior abdominal wall with more fulness in the cyst lay between the folds of the right broad liga- flanks than the speaker had ever before observed in ment, and the rest of it was adherent at every point a cystic tumor. The tumor was removed through a to intestines and abdominal wall. It was enucleated two and a half inch incision. The tluid was viscid exhibited it mainly to show the greatly hypertrophied broad pedicle was transfixed and tied, and over this and dilated oviduct, the walls of which are very thick a tie made embracing the whole. The wound was and were filled with pus. The left ovary being of closed by silk-worm gut sutures, five to the inch, and

REDUCTION OF INVERTED UTERUS.

To the Editor of the Journal:

Dear Sir:—The reading of Dr. W. W. Jaggard's interesting case of the reduction of a chronic invertention of contributing papers, but have not yet ansion of the uterus by colpeurysis, in the last number of The Journal (Jan. 1, 1887), revived an old thought of mine, which I have had no opportunity of putting to a practical test, viz., that doubtless more certainty and promptitude as well as safety, in the reduction of inverted uteri, might be attained by the direct application to the protruding fundus and body of mere purely medicinal and dynamical, or physiological agencies, than by mere pressure or mechanical means alone, though they may be usefully combined. Thus, by the immediate application to the inverted fundus and corpus uteri of astringents and W. W. JAGGARD, M.D., Sec'y. stimulants the vis incita and tonicity of the uterine tissues might be sufficiently increased to cause contraction, retraction, and reduction of the inverted organ more speedily and easily than by colpeurysis or mechanical measures exclusively. The most promising agents to be thus applied to the everted part are acetate of lead, common potassic alum or iron alum, tannin, ergot, nux vomica, strychnia, hotwater douches especially, and electricity by current from fundus to sacrum or abdomen. As most of these agents are directly or indirectly active hæmostatics. as well as astringents and stimulants, they are specially indicated in cases of hemorrhages and other Philadelphia, Penn. Librarian, C. H. A. Klein defluxions from the uterus. Even if not always sufficient of themselves for the reduction of the inversion, these agents could not fail to be more or less useful in connection with pressure by colpeurysis or otherwise. The same principles and remedies are All membership dues should be sent direct to the efficient in relaxation, inversion, prolapsus, and pa-Treasurer, RICHARD J. DUNGLISON, M.D., lock box ralysis of the bowels and other parts, and should be 1274, Philadelphia, Penn. likewise effective in this similar abnormity of the uterus. Believing these agents will act effectively, in the speedy and easy reduction of inverted uteri in all degrees and stages, both acute and chronic, I present them suggestively for consideration and trial.

Respectfully,

GEO. J. ZIEGLER, M.D.

The Saint Paul prize for a specific against Diphtheria; an encouragement of 1,000 fr. to Dr. Alfred Sass, of Paris.

SCHOOL HYGIENE IN AUSTRALIA.—In Australia, says the Sanitary News, the subject of school hygiene has received proper attention in the State schools for some years. The teachers are particularly instructed to be careful about the spread of infectious diseases, and the public health law is stringent enough to secure the exclusion of scholars and teachers from houses in which communicable diseases exist. In the State schools of Victoria, since 1879, a system of object lessons has been given with a view of im parting elementary instruction bearing upon the health of the people. These lessons generally include such subjects as food, clothing, ventilation, cleanliness, and the prevention of infectious diseases. There have also been given at stated times lessons for the treatment of snake bite, for the resuscitation of the drowned, and for the first aid to the injured. The department of education requires some ele-

ON DIABETES.

A Clinical Lecture delivered to the Students of the Western Pennsylvania Medical College, on October 29, 1886, BY W. SNIVELY, M.D.,

PROFESSOR OF CLINICAL MEDICINE, PITTSBURGH, FA. [REPORTED BY R. M. JONES.]

Gentlemen:—The case of the young man whom weight 95 pounds. operate. The sharp pains from which he suffered cæmia. have greatly diminished, but have not entirely ceased. contains a large quantity of sugar.

morbid complexus which we term diabetes. 1st, the correct by Griesinger and other observers. This

presence of a notable quantity of sugar in the urine. This we call glycosuria; 2d, increase of the urinary secretion, or polyuria; 3d, increase of thirst, or polydipsia; 4th, increase of appetite, or polyphagia; 5th, emaciation, or autophagia. The four first phenomena are contemporaneous in their appearance; the fifth appears later; there is nothing definite in the

period of its development.

The polyuria is the result of physical conditions, easy to comprehend. Glycosuria is not the effect of a pathological work, located in the kidneys; this primordial symptom is the direct consequence of the I present for your consideration to day, affords us an presence of sugar in the blood in abnormal quantity; opportunity to study a very interesting disease. I there is glycosuria only because there is glycosmia, feel certain that many of you will make a correct and this alteration of the blood holds under its imdiagnosis when I read you his clinical history. SHORTENING, BY OPERATION, THE BONES OF THE LIMBS IN THE TREATMENT OF INJURIES COM-PLICATED WITH EXTENSIVE DESTRUC-TION OF THE SOFT PARTS.

BY WILLIAM D. HAMILTON, M.D.,

OF COLUMBUS, OHIO.

In the issue of The Journal of August 14, 1886, In a case of chronic mania in a man who has a page 176, appears an abstract from the Gazette Medlesion of the mitral valve, compensatory hypertrophy icale de Paris, under the above title. Dr. Martel, of of the heart having taken place, the parallehyde gave St. Malo, saw a patient June 2, 1885, with severe most excellent results. I would state parenthetically compound fracture of the leg. Anteriorly was a that chloral has frequently been administered in this large wound, whose extent was due to actual destruccase without ill effects. Sometimes chloral produces tion rather than to retraction of the skin and subjaa state of intoxication which forces the patient to cent tissues. On February 25, 1886, he made an occupy the recumbent posture, but neither allays oblique resection of both bones of the leg. On excitement nor produces sleep. In this class of cases March 25 union had occurred; April 25 consolidation was complete. August 3 two ulcerated spots The method of administering paraldehyde is im- remained, which soon healed. The author is only portant. It can be given in mucilage, syrup or cognizant of a single case like his own: that of Karl whiskey, preferably in whiskey. At the Lunatic Loebker, who, in 1884, resected the radius and ulna Asylum we give one part paraldehyde in three of in continuity. My own case was reported to the whiskey. No difference in the action of the drug is Central Ohio Medical Association on the first day of perceptible when mucilage or syrup is used as the last April, the patient being presented at the time for menstruum, instead of whiskey. Whiskey disguises examination. I first saw her with Dr. Lewis Hoover,

To check the hæmorrhage, which was As a rule, the results were excellent, no unpleasant quite profuse, the divided ends of the anterior tibial after effects having been caused in a single instance, artery were tied with gut. The periosteum was well Urethan is an analgesic, as is shown by its action in retracted and a transverse, even division of the bones gout, rheumatism, etc. Its action is chiefly on the was made above and below the injury, and the intercerebrum, and it has no influence on the medulla vening fragments were dislodged. It involved the oblongata or cord. No interference with the action removal of two inches of both tibia and fibula. Neat apposition was secured without wiring or suturing. The dose of the drug is 15 grs. I have used it Several layers of over and over gut stitching united only in insomnia of mania, and have found sleep re-the edges of the wound. A small opening was sult uniformly after the ingestion of the above-named left in the lower angle for drainage. No tube dose. As toxic symptoms have never as yet been was used. Thorough irrigation was followed by the produced by the drug, I can tell you nothing of use of iodoform gauze and other antiseptic absorbthem, nor of the amount necessary to produce them, ent dressings. A padded posterior splint with a I have seen sleep, apparently natural, as the only rebandage over all, secured immobility. The temperasult of the administration of urethan. If the promitive was normal, or nearly so, from the third day, is ses which urethan holds out are fulfilled, it will prove an addition of very great value to our materia medica. July the dressings were changed. August 7 she sat up and a plaster dressing was adapted. There was neither pain nor spasm during convalescence. Every-

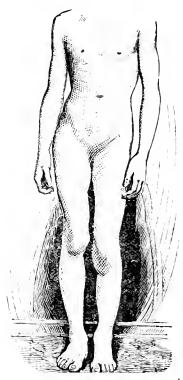

thing was taken off on October 19.

For several months, the temperature of the limb was lowered. It had a dusky hue, its nutrition and innervation being seriously impaired. The complete everything to be done by the posterior group. When October, 1885. first seen, mortification seemed imminent. The operation had two things in view:

ducing prompt union throughout; the idea being to remove bone which occupied the gap, and which, being the focus of inflammation and suppuration, above the pubis, and mainly in left side. Bimanual threatened the posterior blood and nerve supply. 2. Or to anticipate a probable long siege of periostitis,

ostitis, necrosis or osteo-myelitis.

The accompanying cut shows the patient thirteen months after the injury. Both heels are on the floor, which gives a clear conception of the postural de- painful, and we were frequently importuned to operformity. The following measurements are further explanatory of the result:

	Lett.	Right.
	(injured)	
Circumference over cicatrix	7/2 in.	
Length of cicatrix	4 **	
Distance from head of fibula to outer malleolus	10% (1	1213
Distance from upper ext of fibula to internal malleolus	1014 11	11^{1}_{2}
Circumference of calves	83, 11	1013

Dr. Martel is to be congratulated on his good result. His operation was a secondary procedure; this was primary. It would not pay to try to generalize with these three cases for a text. They may be sufficient to raise a question, however, as to the propriety of exsection in certain bad cases of compound fracture.

No. 126 E. Long St., Columbus, O., Sept. 9, 1886.

LAPAROTOMY FOR REMOVAL OF MONOCYST OF OVARY.1

BV T. W. HURLLY, M.D., OF DESCRISSIBLE, ARK.

I saw for the first time, and examined Mrs. H. in division of the anterior blood vessels and nerves left consultation with Dr. Hartly Weems, of Rogers, in

Patient at. 36, marned nineteen years; no children, no abortions; physical condition fairly good; 1. To prevent gangrene and save the limb by in- has had an abdominal tumor for very nearly two years. No cachexia. A tumor of considerable size was felt in the abdomen, reaching about six inches

exploration gave but httle pain.

The character of the tumor was explained to the patient, and she was told that nothing short of an operation would afford any permanent relief. As the disease progressed it became more and more ate. A puncture was spoken of, but the patient, on being told that the procedure would in all probability be only palliative, insisted on a radical operation. An operation was determined on and the patient put on preparatory treatment, mainly tonic and hygienic. Drs. Welch and Gray, of Fayetteville, were requested to meet us in consultation on January 18, 1886. After careful examination and consultation an operation—ovariotomy—was concurred in, and 10 A.M. the next day the time for the operation.

Ten o'clock A.M., lanuary 19. The patient, seeming cheerful and in good condition, was placed upon the table, and Drs. Gray and Weems administered a mixture of chloroform and ether. The patient was one of the most difficult to bring under its influence, requiring an hour and fifteen minutes to properly

anæsthetize her.

Assisted by Dr. Welch, abdominal section in the median line was made, and a large monocyst which had developed from the left ovary was exposed. The cyst was partially evacuated, drawn out as nearly as possible and cut off. There was no pedicle, and very little adhesion. The intra abdominal wound was well constricted by silk suture with several threads, and left in the abdomen. The external wound was closed and dressed antiseptically. The toilet being completed, the patient was carefully taken from the table and placed upon the bed. The patient, at this time having returned to consciousness, did not seem to be in an unfavorable condition; but in about half an hour was observed by Dr. Welch to be in an alarming state-extreme pallor, cold surface, frequent pulse, and feeble respiration. In addition she showed a marked and unceasing restlessness, to which succeeded vomiting and painful eructations. These symptoms, with but one short respite-when the temperature rose to about 100°, and soon falling below 96°-presaging a fatal issue, which finally occurred from total collapse at 8 o'clock P.M. the 20th, about thirty hours from completion of the operation.

I think I may say now that the difficulties and

number. Among them may be mentioned hydrocyanic acid, potassium bromide, ammonium bromide, hyoscyamus, digitalis, alum, lobelia, ipecac, potassium bicarbonate, belladonna, atropine, opium, morphine, musk, sodium et aurum chloride, cocaine, tartar emetic, insufflation and inhalation of quinine. Success and failure have followed the use of each.

In the Medical Record, of July 17, 1886, is an editorial on the treatment of whooping cough, and among the remedies mentioned is narceine. This but not very abundantly. Has had four difficult alkaloid was introduced as a remedy for this disease labors, the last one ten years ago. Three weeks ago by Laborde, as far back as 1869, but the physicians of Philadelphia who employed it about ten years ago failed to obtain the results which were claimed for it. The recent visitation of the disease has afforded me out by a solid, elastic, circumscribed, movable tumor, a peculiar experience.

It was my intention to thoroughly test this treatment; my reasons for not doing so will be seen from what follows. On July 12, W., born July 3, showed symptoms of whooping cough, his mother having contracted the disease five days before his birth. He was given on the 19th the following prescription, other remedies having failed to afford relief:

HOSPITAL REPORTS.

MYOFIBROMA UTERI.

CLINIC OF PROLEPOKITANSKY, OF VIENNA. [Reported by Hopano R. Bigelow, M.D.]

G. H., 48 years old, married fourteen years. For over one year has had the menses every fortnight, had a strong hamorrhage. On the right side of the abdomen there is an ulcer. She is an emic, small and thin. The lower half of the abdomen is vaulted not painful, the walls of which are tlat and extending out of the pelvis. Vagina of normal length. The vaginal portion of the uterus is long and broad. The anterior lip is thickened. The posterior lip is flat and thin. Bi-lateral cervical laceration. The interior surface of the anterior lip is soft and swollen; bleeds easily. Through the anterior vaginal roof the enlarged fundus can be detected easily. Circumference around abdomen, four fingers width under navel, So ctm.; uterus 27 ctm.

On account of violent hæmorrhage she was at once received into the hospital, but was soon after discharged, as the bleeding stopped and as she did not This would make the dose .0110 gm. (gr. 16) the wish, to be operated upon. On November 18, 1885, The whooping-cough ribs, but she had no other signs of pleuritis.

On November 23 the pains ceased entirely, but with a linen cloth, moistened in a two per cent. This is one experience with narceine. The dose carbolic solution, which was left in situ 20 hours.

On November 20 temp. 37°, pulse 105. Carbol-

Operation.—Chloroform. The primary incision, reports made concerning the use of "Narceine in made with great care to avoid wounding the bladder, extended from the navel to within 3-4 ctm. of the sym. pubes. Parietal adipose 2 ctm. thick. Arteries caught with forceps. When the tumor was disclosed it was found to be smooth, and not adherent to the anterior uterine wall. The incision was found to be too short for its enucleation, so it was extended to a total length of 25 ctm. In the peritoneum was a

MEDICAL PROGRESS.

LIPROSY.—The Hawaiian Legislature, in its determined efforts to try to control the spread of leprosy in the islands, was fortunate in securing the valuable services of Dr. EDWARD ARNING for purposes of or kokuas, on the settlement who contract the disspecial research. He found the bacillus leprie plenti- ease. Of 178 kokuas, 17 developed leprosy between fully in all nodules and diffuse swellings of the tuber culated cases and in similar lesions of the mucous membrane of the mouth, throat, nose, rectum, and large intestine, and in the discharges from the ulcerated lesions. He recognizes a diarrhoea arising from as the differential diagnosis between these affections: the leprous ulceration of the bowels closely simulatusually ascribed to intercurrent pneumonia, tubercu- (years. lar phthisis, and dysentery should be more correctly

little ascetic fluid. As the tumor extended so deeply in the early bright red patches of vaso-motor congesstrong solution in traumaticine. Arning declares The stump was painted every day with a concenthat, for one reason or another, he found it impossiand of those who have survived many have not yet developed leprosy. No congenital cases have been observed, but Arning saw two well-marked lepers aged respectively 312 and 4 years. Dr. Mouritz points out that, whilst it is perfectly true that healthy people may live with tubercu'ated lepers for years without contracting the disease, many on the other hand do not escape, and he especially refers to the remarkable percentage of the non-leprous assistants, February 1885 and 1886.—Lancet, Dec. 4, 1886.

> SARCOMA AND CARCINOMA OF THE BREAST,-In a lecture on this subject TILLAUX gives the following

> LANGLIN MERCURIAL OINTMENT.—DR. BERNARD Brands, of Aachen, in his work, "Principles of the Treatment of Syphilis," writes as follows: "I must also mention the mercurial ointment brought forward by Professor O. Liebreich, of which landlin forms the basis. It is thus prepared: 100 parts of mercury, 25 of lanolin, and 5 of (grey) mercuryointment are rubbed together thoroughly till all the mercury disappears, which very quickly happens, and then mixed with 50 parts of mutton-suet, to which, in the melted condition, 175 parts of lanolin have been previously added. An elegant and smooth preparation results, without any disagreeable odor, and the trials of it here mentioned speak most emphatically in its favor. Those who use it upon patients boast of the ease with which it is "rubbed dry," and we may presume that the mercury is rapidly taken up by the skin."—London Medical Record, Nov. 15, 1886.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No. 65 RANDOLPH STREET.

CHICAGO, ILLINOIS.

SATURDAY, JANUARY 22, 1887.

OBSTACLES TO THE FORMATION OF PERMA-NENT COUNTY MEDICAL SOCIETIES.

In The Journal of last week, we called attention patients. to the necessity for more complete and universal orwithin their limits, and still more need for the prompt they prove to be. formation of new societies in all the counties where

conferences, synods, conventions, etc., and their Iournal of the American Medical Association, weekly ministrations before the public. The same end is obtained substantially for the members of the legal profession by their frequent contact, and open intellectual encounters at the bar of the several courts. But, for the great mass of the members of the medical profession, the local organized and actively sustained medical society affords the only opportunity to meet one another on common ground, each contributing something to the common stock, and each mentally imbibing something of value to himself and his patients, while the emulation or ambition for closer study and higher attainments, is more or less excited in all. To the younger members of the profession especially, the opportunities of active society work are of inestimable value. He who embraces them with a fair degree of diligence rarely fails to advance in his attainments and reputation, while he who neglects them, soon loses his habits of study, early lapses into a mere routine practice and is seldom known beyond the limited circle of his

The second obstacle consists in attempts to make ganization of the profession, in all its departments, the machinery of these organizations too complicated into County or small District Societies, as the basis and therefore difficult of execution. Many a social of efficient and truly representative State and National organization has come to an early death through organizations. It was further stated that we have vain attempts to enforce the details of its elaborate already such societies in nearly every county of some and ingenious system of rules and regulations. The States, in a majority of others, and in only a few of more simple and brief the constitution and by-laws the remainder; but that in all those existing, there is of a local medical society can be made, having for need of having the active membership embrace more their paramount object the mutual improvement of nearly all the regular members of the profession the membership, the more efficient and durable will

The third obstacle in the way of effecting and none now exist. Experience has shown the existence maintaining a general and harmonious organization of three chief obstacles in the way of the complete of the profession is difficult to define, and still more voluntary organization of the profession in a country difficult to remove. It seems to have its origin in embracing so vast a territory as ours. The first is the undue development of the selfish tendencies of the lack of appreciation of the advantages to be de-the human mind, and may generally be recognized rived from such organization, on the part of a large in one of the three following forms: It has not reclass of practitioners. Without due consideration quired fifty years of personal observation to find in they let the comparatively trifling expense and time every populous community one or more medical men required for attending a County Medical Society, who make large pretensions to education and profesonce or twice a year, deter them from making any sional skill, who are prominent in social clubs and movement in the matter. This class, though numer-places of amusement, but when asked to join the ous, only require to have the real advantages of active local or county medical society, promptly tell you to membership in such medical associations fairly brought "go to the dogs with your medical society. Do you to their attention, to secure their cooperation. The think I want to go there and listen to an essay from members of every learned profession need some that young upstart Dr. C., who has not had half a method by which its working members are, at stated dozen patients since he left college, or to hear old intervals, brought in contact with each other and granny D. relate a case of hysterics?" This may be more or less before the public. This is secured for styled the pompous form. Still more easy is it to find the clerical profession by the stated meetings of their members of the profession fairly well educated and

gentlemanly in their deportment, but whose ready answer to all solicitations for them to sustain any fested by a large class who never lack time to attend as abscesses elsewhere. cities may be found a small group of most influential and whatever its immediate surroundings may be." the State or of the Nation. More than any other in operating. equal number of members of the profession are they capable of giving efficient support and scientific pancreas we, of course, must remember that suppurcharacter to the medical organizations of all grades— ation here, as elsewhere, is only one of the termina-County, State and National; yet, by their almost tions of inflammation, and that the abscess, like the total neglect, they strongly influence many others to inflammation, may occur primarily in the pancreatic follow their example. If you solicit them for papers, gland, itself, or it may begin in the para- or peripanand personal attendance, the almost uniform reply is, creatic tissue. When endo pancreatic, or in the gland, that they either have no time, or they are so much it "may be bounded and circumscribed by the proper worn out by their labors they must make a trip to investment of the gland; if, on the other hand, it comthe mountains or the sea-side, or more likely across mences primarily outside the gland it appears as a the Atlantic, to restore their energies, and very likely diffuse abscess, which extends to the pancreas by look in upon some medical society meeting on the contiguity; in other words, we speak of the abscess other side. The latter step has, indeed, been so as a suppurative pancreatitis, or a suppurative perifrequent with some during the last two or three decades that their writings show them to be more familiar with the society work and medical literature tive relation between pus microbes and suppuration, of some of the countries of Europe than they are of it must be taken for granted that suppurative pantheir own.

Widely different as are the three groups we have just described, they all agree in practically ignoring all obligation to personally sacrifice either time or thought in establishing and maintaining such local, State and National Medical Associations as are necessary to advance the educational, scientific and practical interests of the whole profession.

ABSCESS OF THE PANCREAS.

If there be one well established principle of general organization of the profession of a county or modern surgery it is that suppurating cavities must State, is: "Oh! I do no general practice-attend be treated by incision and drainage, wherever this only to ophthalmological or gynecological cases, and cavity may be located. One reason of this may be its are carnestly engaged prosecuting scientific or literary rare occurrence; and another that there are many As a rule, the members of this class give no difficulties in the way of recognizing the condition. attention whatever to the city or county organizations The difficulties will, however, be removed by imof the profession, and only at long intervals to those of proved methods of examination, and greater skill

> In looking at the pathology of abscesses of the or para-pancreatitis."

As there now seems to be no doubt as to the causacreatitis, of whatever kind, is caused by the presence of these microbes in the tissues. The suppuration always begins in the interstitial tissue, either within the gland or in the connective tissue around it. Peri-pancreatic suppuration usually begins in the adjacent lymphatics; the pus surrounds the lymph glands or forms a small abscess. lymphatic abscesses are sometimes met with near the pancreas in pyæmia. The abscess may begin on the outer surface of the gland, and the pus separate the

gland from its attachments. Gendrin records a case the immediate vicinity? these may become involved in which it was lying loose in the abdominal cavity. by extension of the suppurative process, leading to In some cases the pus burrows in the region of the suppurative thrombophicbitis. The most favorable mesocolon and the retroperitoneal space, and may spontaneous termination of these cases is perforation thence find its way into the peritoneal cavity or the of the abscess into the stomach or intestinal tract; alimentary canal. Again, a calculus in the pan-, and in one case this has resulted in cure. A great difficulty in this favorable. Progressive emaciation and inanition, or operation will be the approximation of the peritoneal septic absorption, or secondary lesions in adjacent surface of the abscess with the margins of the organs are usually sufficient to cause death. In wound; a difficulty which increases in proportion to cases of acute diffuse pancreatic abscess death may the prominence of the swelling. The external intake place in a few days. A very great danger of cision should be large, as the margins of the wound these abscesses is the number of important veins in can then be turned in, which facilitates suturing of

culties in the way of operating in this region than in There are not always characteristic or positive other portions of the abdominal cavity. "Multiple symptoms of the presence of pus within the pancreas abscesses, disseminated throughout the entire organ, or in its immediate vicinity; in fact, the symptoms and especially its head, are not amenable to successalways point to the stomach or liver as the seat of ful surgical treatment. Circumscribed endopandisease. Nausea, vomiting of a clear greenish or creatic abscess in the peripheral portion of the body viscid fluid, thirst, anorexia, constipation, progressive or tail of the pancreas should be treated by partial emaciation, and distension of the epigastrium are excision of the pancreas in all cases where the isolathe more prominent and constant symptoms. In tion of that portion of the organ can be accomplished the recorded cases the patients as a rule, were very without inflicting serous injury to adjacent important anæmic, and presented a sallow, cachectic appear- organs. When extirpation is impossible, as when the ance. In a number of cases ascites and cedema of abscess is located in the head of the organ, it must cases there was biliary retention from extension of complished in the same manner as in the treatment the inflammatory process to the bile-duct, or from of a pancreatic cyst. In some instances the access stenosis of the bile-duct from compression. Fever is rendered difficult by distension of the stomach, is neither a conspicuous or a constant symptom of the dilated organ overlapping the pancreas. In the condition. If the abscess be large palpation such cases the stomach must be pushed upward, and and deep percussion will show a tumor in the epi- subsequent distension guarded against by ordering often serve a useful purpose in the differential diag-| established. The external incision must, in all cases nosis of tumors in the epigastric region; and manual correspond to the most prominent part of the swellthe anterior wall of the abscess to the margins of the "THE CHICAGO CINCHONA COMPANY; OFFICE, wound. There is but little danger of puncturing the abscess-cavity with the needle, as the anterior wall of the abscess is generally covered by peritoneum and is of considerable thickness. Evacuation of "private and confidential," setting forth the formation the abscess by aspiration, before the operation, will cause recession of the abscess wall, and thus render approximation difficult; but it may be done if the swelling is so prominent as to render this a secondary The sutures of the peritoneal surfaces should be of silk, should be placed close together, and grasp the tissues so that tearing out will be impossible; for the object of the sutures is to prevent escape of pus into the peritoneal cavity, and to secure permanent adhesions of the abscess wall to the margins of the wound. Incision and drainage should follow immediately upon the suturing.

"The remaining steps of the operation will depend upon circumstances. If the abscess is endopancreatic or peripancreatic, simple incision, drainage, and disinfection will answer all indications. If, however, the purnlent cavity is located behind the peritoneum and occupies the connective tissue space behind the pancreas, it would appear rational to drain the abscess posteriorly through one of the closed forceps in a proper direction through the posterior and lateral wall of the abscess until its ner the most desirable method of drainage-through drainage-could be established, which would render subsequent disinfection and evacuation of the abscess a comparatively easy task. In cases where an anterior pancreatic fistula cannot be established on account of the distance between the abscess and the anterior abdominal wall, we might resort to lumbar drainage and closure of the incision in the anterior wall of the abscess by carefully inverting and approximating the peritoneum over the wound with fine silk sutures. The abscess found and located by abdominal section should be removed by partial extirpation of the pancreas when it is endopancreatic and located near the splenic end of the pancreas. When extirpation is impossible, or when it is located in the head or on the anterior surface of the pancreas, it should be treated by the formation of an anterior abnormal fistula; when located behind the pancreas, by through drainage, or lumbar drainage performed through the abdominal cavity."

PALMER HOUSE."

We have received from a physician in a neighboring State a printed circular, marked by its author of a company by the above title, and with a capital stock of \$500,000, for the purpose of manufacturing and selling "D'Unger's Cinchona Cure for Drunkenness." The company claims to have purchased the formula and all details of its preparation from Dr. D'Unger; and while setting forth in the usual style its virtues as "a certain cure for drunkenness and the morphine habit," this "private" circular shows the real nature of the speculation in the following paragraph:

"The capital of the company has been fixed at \$500,000, the price of each share being \$20. Of this sum, \$250,000 has been placed by the former owner of the formula in the treasury, to be allotted to such physicians as may desire five or ten shares of it at twenty-five cents on the dollar." This offer is made to physicians only, and is rendered more tempting by the strong assurance that after the remedy is fairly introduced to the profession, it will yield "annual dividends of at least 25 per cent. to the stocklumbar regions above the kidney by pushing a long holders." The circular is signed by E. S. S. Kemp, President, and Henry Plowman, Jr.. Secretary.

As the so-called "D'Unger's Cinchona Cure for point can be felt under the skin externally. A small Drunkenness" has been advertised (and sold by its cut in the skin over its point will enable the operator; "former owner") in the daily papers of this and to push the instrument clear through, and, by dilat-rother cities for five or ten years past, until its worthing its blades, widen the canal sufficiently to permit lessness is as well known as is that of all the other the insertion of a large dramage tube. In this man-advertised cures for drunkenness, etc., it is hardly necessary to caution the most credulous member of the profession against wasting even a postage-stamp on inquiries concerning it.

> SECTION OF OBSTETRICS AND DISEASES OF WOMEN, OF THE AMERICAN MEDICAL ASSOCIATION.-In THE JOURNAL of last week we published a preliminary programme of work for this Section as furnished by the President and Secretary of the Section, for the coming meeting in June. The number and character of the parties named in the list affords a guarantee of an excellent meeting. We now are requested by the Secretary to add to his list the name of another eminent writer, Dr. H. F. Campbell, of Augusta, Georgia. Which Section will follow next with an equally good showing?

THE NATIONAL CODE OF MEDICAL ETHICS.—Our tcheap Reprint edition of the Code of Ethics of the

American Medical Association is ready. Physicians except when in an attack, when she would require or others wanting single copies should send a two the strength of a number of women to hold her, incent postage stamp to pay the cost of the reprint and a one cent stamp to pay the postage. One hundred has been much worse since marriage than before. copies can be sent for \$2.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, November 24, 1886.

The President, C. H. A. Kleinschmidt, M.D., in the Chair.

H. M. Cutts, M.D., Secretary.

Dr. D. S. Lamb presented for Dr. J. Taber Journson the specimens and read the histories of

THREE CASES OF OVARIAN DISEASE.

on the 20th day, perfectly well.

afterwards, she had the most active and distressing out benefit. clonic spasms. She would, on some occasions, re- Case 3.-Mrs. W., white, age 49, married, the

cluding those in the house and what neighbors would come in, until her husband could be sent for. She The patient was unable to do much, if any useful work about the house. She complained of almost constant pain in the pelvic region; and was losing ground mentally as well as physically. When I was asked by Dr. Bayne to see her, I was informed of her previous history and present condition. A vaginal examination caused much pain and brought on convulsions. I did not then feel her ovaries. Though requested by the attending physician, the patient and her family, to remove the uterine appendages, her case did not seem to me, at that time, to be one which held out a very strong promise of cure by this operation, and not wishing to have a failure, I deelined to do it. Two months later their importunities were so great, and also their anxiety to take the risk of a cure, as well as the risk to life, which were fully explained to them all. I made another examination under ether. I found the ovaries atrophied and adherent to the tubes and surrounding structures. Case 1.—On the 18th of Oct., 1886, I saw Miss Believing that cause enough existed for the produc-L., at the request of Dr. B. B. Adams of this city. tion of her symptoms, I agreed to operate. I had She was unmarried, age 31, and had been well up to the patient take a private room in the Providence three months ago, except attacks of typhoid fever Hospital, and on the 27th of October I removed her and jaundice, which she had four years ago. Her uterine appendages. It is now five weeks since the sisters first noticed her change of form which pro- operation, and barring her use of opium, which is an gressed with unusual rapidity, until she reached the old habit, her present condition is all that one could size of a woman eight or nine months pregnant, expect or wish. I anticipate that she may have Her condition attracted the attention of friends and slight spasms for a while, at the time when her periods neighbors, and though quite able to do so, she re- are due, but hope they will grow less and less severe luctantly appeared in public. Her disease so preyed until they finally disappear. Her change of life, proupon her mind that she lost flesh rapidly and was fast duced by the operation, may not be any more sudbecoming an invalid. Upon my advice she took a den, than when it occurrs in the usual way. If at private room in the Providence Hospital, and on the the end of two years she is free from her old troubles, 23d of October, 1886, I made a two inch incision. I shall feel that the operation is a success, and was and removed what proved to be a parovarian cyst, properly done. If she is no better I shall regret it, weighing twelve pounds. She has up to this moment. The evidence in recent medical literature is not conhad no unfavorable symptoms. She left the hospital clusive on this question. Even Sir Spencer Wells in the recent symposium, in the American Journal of Case 2.—Mrs. C., white, age 24, married for three Medical Sciences, does not decide against it. He years; has been subject to most dreadful attacks of says he thinks every thing else should be done first, menstrual or ovaro-epilepsy, for the past ten years. and well-done and continued for several years, and She was sent to me by Dr. J. W. Bayne. Mrs. C. that all the risks of the operation should be explained had been under the care of at least twelve different to the patients and their friends; and so do I. But physicians, including Dr. Hammond, of New York, what shall we do with those patients who resist all She had been told repeatedly by Dr. Hammond and treatment, marriage included, for years, and are others, that the cause of her trouble was ovarian, and growing worse? This operation must continue to believed to be incurable, except by removal of those have a limited field of usefulness in nervous diseases During these ten years the patient had where all other treatment has failed. Battey in his worn out the endurance of as many doctors who had part of the recent symposium above referred to, propassed her on to the next, and of several hospitals, duces unimpeachable evidence of the beneficial and which had discharged her, after exhausting their lasting effects of the removal of the uterine appendnurses and drugs to no purpose. She had tired out ages in both nervous and mental diseases. I join relations, friends and neighbors, in watching and those who cry out against the abuse of this operation, holding her. While her periods were less than but I am in favor of it after other means have failed, normal and irregular, the menstrual molimen occurred rather than allow this class of patients to die or to with painful regularity, and before it, during and repeatedly go over the same dreary old ground with-

of the body.

NASAL POLYPUS,

and said he thought it instructive by reason of the beauty, freshness, and unusual dimensions of the

The history of his patient, briefly stated, is as follows: John K., white, male, aged 18 years, born in Ohio, now a resident of Washington, D. C. The patient first noticed the polypus in August, 1882, in the right naris. It grew slowly, giving little trouble. In November, 1885, he was operated on by Dr. Blank, of Columbus, Ohio, who clipped off a small portion of the tumor. Patient breathed freely for about one month, when the tumor rapidly increased in size. He was much affected by cold in the head, and by changes of temperature, and the tumor often protruded as far down as the lower lip. When the cold was relieved the tumor retracted within the nose. I operated on him at 3 P.M. to-day, Nov. 24, 1886, when the tumor was just even with the anterior nasal orifice. The polypus was removed in the presence of Drs. Thos. A. Taylor and Frank Chamberlain, is of the mucous or gelatinoid variety, weighs snare and by the aid of reflected light.

The polypus was extracted through the right anterior paris. There was slight bleeding and pasal respiration was completely restored. It is, however, removed, and a second operation may be required, as in other cases.

DR. J. L. El for read a paper entitled

NAFCLINE IN THE TREATMENT OF WHOOPING-COUGH. (See page 92.)

Dr. Busey replied to Dr. King that he thought the logical conditions present in these rare cases of cause of pain was the rupture of the duct or whooping-cough which prove fatal by convulsions. receptaculum chyli, and to Dr. Cook that there was Is it a defect of the respiratory centre or thrombosis

Dr. G. B. HARRISON said that it is frequently only slowly through a small opening the peritoneum stated that a second attack of whooping-cough is readily reabsorbs it, and patient suffers no very great rare. It seemed to him that a second attack was emaciation. In cases where there has been a large not uncommon, and he knows of several persons who

Dr. A. F. A. King said he was aware that the exprobably here also kept alive by reabsorption by the anthemata attacked the child in utero, but he failed peritoneum. There is a case reported by Poncy which to see how whooping-cough would reach it before he tapped twenty-two times in six months, removing birth. If a child presents the symptoms of pertussis 285 litres of chyle. Here the color and smell of on day of birth it must have had the prodromal foods given could be recognized. Usually there is a symptoms in the womb. As children born after having had small-pox in utero are to some extent ex-Dr. King said that he thought that the odor of empt from it in after life, he does not see why the some foods, as onions, could be detected in all fluids same should not be true of pertussis. He mentioned a case of twin birth where only one child had small-Dr. E. Carroll. Morgan presented a specimen pox, and stated that Morrison, the obstetrician, was born with small-pox pustules, though his mother did not have it at the time, but was only nursing a son with the affection.

> Dr. Busey said that he had never heard of a case of congenital whooping-cough.

> Dr. King said that he did not mean to imply that the child actually coughed in utero, but if born with whooping-cough when did the catarrhal process in the lungs begin?

> Dr. J. L. Ellor said that he did not think, at any rate, that the narceine was the cause of the convulsions, as the dose was small and the effects had passed off several days before.

> Dr. S. S. Adams questioned the diagnosis made by Dr. Eliot. He said that it was extremely difficult to tell at that age what is the matter with a child. The pathognomonic symptom of pertussis is the whoop, and even that may be produced by simple laryngitis. He did not rhink that narceine would produce convulsions, but congestion of the kidneys following its use might. He said that there was no specific treatment for whooping-cough.

Dr. Busey objected to the statement that pertus-265 grs. (5ivss), measures four and a half inches in sis could not occur without the whoop. For inlength and one inch in its greatest breadth. The at-stance, all of several children of a family cough; all tachment was apparently to the posterior extremity present the same phenomena except that one does of the lower turbinated body, and the wonder is that not whoop. If this was an isolated case the diagnothere was not regurgitation of the polypoid mass into sis would be uncertain. But if whooping cough was the pharynx, for it was not adherent anteriorly, allow- epidemic and the others undoubtedly had it, he ing the wire loop to be passed freely over its entire thought it fair to say that the child who did not whoop length. The operation was done with a Douglas had it also. Usually the cough and whoop are associated, but the latter varies in degree and intensity, and may only occur once or twice, or not at all, during the attack. He thought that there was no medicine which could stop the disease, but it could be not certain that the entire polypoid mass has been cut short by treatment. The epidemics also vary in severity and contagiousness, and the remedies successful in one will fail in another. The season had its effect. In autumn and winter attacks were less controllable. Climate and hygienic surroundings were elements to be considered. He has seen one death preceded by convulsions, and thrombosis of DR. S. C. BUSEV asked the cause of the convul- the cerebral sinus was probably the cause. The sions, as it is very important to find out the patho- case just reported may have had pneumonia or atelectasis. Wörterbuch der Bacterienkunde. Bearbeitet von Dr. W. D. MILLER, Professor am Zahnärztlichen Institut der Universität Berlin. Stuttgart: Verlag von Ferdinand Enke. 1886.

DICTIONARY OF BACTERIOLOGICAL SCIENCE. By Dr. W. D. MILLER, Professor in the Dental Department of the University of Berlin. Sm. 8vo. Stuttgart: Ferdinand Enke. 1886.

To Professor Miller the Profession in general and bacteriologists in particular should be grateful for The President, Dr. Jacobi, said that he quite this Dictionary of Bacteriological Science, which he has so carefully and laboriously compiled. In this,

Prof. Miller is the first and only American who has ber of days. For twenty-five years, he said, he had been raised by the German Government to the hontaught that the disease could not be cured unless orable position of Professor in the University of milk was given up as a food; but there were plenty Berlin. He has discovered, described and named of things which could be temporarily substituted for several microorganisms, perhaps the most important it. He himself generally used the white of egg, raw, of which are those which cause dental caries, and the Miller bacillus. The latter is a comma bacillus found Dr. Peabody said that he had come to look upon in the human mouth, and which, though for a long naphthaline as a very valuable addition to our thera-time recognized as morphologically similar to that peutical resources in a number of intestinal come ascribed by Koch to cholera Asiatica, and to that by

Collective Investigation on Centenarians.-cal names and expressions which appear in the The late Dr. Farr has shown, in his "March of an English Generation through Life," that one million children born in England live forty million, eight hundred and fifty-eight thousand, one hundred and eightyfour years, that two hundred and twenty-three live to the age of one hundred, and that finally at the age of one hundred and eight, one solitary life dies.

In the supplement to the British Medical Journal of December 11, Prof. Humphry has analyzed the In this little book Dr. Meigs attempts to show that returns from reliable medical men regarding fifty-two centenarians tabulated from the results of a form of eleven was the age confirmed by any official record, but the others were naturally assumed to have at being intimately acquainted with the individual.

> In eleven the intellect is stated to have been high, and low in only five; twenty were reported strong, sixteen of average strength and twelve feeble. Thirtysix were women, sixteen men—a fact explained by Mr. Humphry partly by the fewer exposures of women, notwithstanding the dangers incidental to childbearing and the diseases associated with the varying demands made at different periods upon the organs connected with that process; and partly also by the greater inherent vitality in the female.

> Of the thirty-six women, twenty six had been marfore they were 20, one at 16 and two at 17. Many Forty-one of the fifty-two had been married. Twelve were first cousins.

The average centenarian qualities were a good poisoning; paralysis, if not recent, progressive, or family history, a well-made frame of average stature, spare rather than stout, robust, with good health, appetite, and digestion, capable of exertion, good gence, with little need of, and little consumption, of

Three were affluent, nineteen poor, and twenty-

Twenty-four of the centenarians had no teeth, and the average number retained was only four or five. one was deaf.

The majority were moderate or small eaters, but maintained an average pulse of 70 and respiration of 22-a fact explained by the diminished elasticity of the circulatory and respiratory apparatus. The arteries had become less capable of accelerating the blood-stream, and the vital capacity of the chest was much reduced, as shown in the slight difference in the chest girth between the state of inspiration and that of expiration. The hours of sleep averaged nearly nine, the extremes being twelve and four.

The brain held out as well as the other organs. perhaps better; two only were demented. The weak-

equal in the several great organs.

The majority had suffered little from illness at former periods, vet some had recovered from severe diseases. The habits of life were generally such as conduce to health, necessitated in a measure, at least, hol, twenty-two took little, eight drank moderately. one drank to excess, on festive occasions, one was a 13, 1887.

since the year 1841. It has been lately brought for- get there! ward in France as a disinfectant, and Dr. Huppe (Contrach, f. d. Med. Wiss., No. 50, 1886), has made experiments with it, which have led him to the opinion that it possesses advantages entitling it to rank beside carbolic acid and bichloride of mercury. Commercial aseptol is a syrupy liquid, having a faint odor of carbolic acid. It is soluble in all proportions in water, alcohol, and glycerine, and even in a 10 per cent, solution has no caustic action upon the skin. Such a solution kills spores of anthrax in thirty minutes, whilst a 5 per cent, carbolic acid solution requires at least twenty-four hours to produce the same effect. A 3 or 5 per cent, solution of Major Harvey E. Bi wn, Surgeon, granted leave of absence for aseptol is a true disinfectant for spore-free microorganisms, or for such as do not form endogenous spores. A 3 per cent, solution was found quite sufficient to disinfect the (previously cleansed) hands. Solutions of aseptol in alcohol, glycerine or oil in the list named no permanent solution takes place showed no disinfectant power. By heat it is changed into the corresponding para combination.

DEATH OF DR. JOHN SCOTT.-John Scott, M.D., First Lieut, Geo. F. Wilson, Asst. Surgeon, leave of absence M.R.C.S.L. of San Francisco, died of acute pericarditis on December 24. He was born in Ireland. and was about \$8 years of age at the time of his death. In his carly professional life he was in India for a number of years. When he came to New York in 1805 he spent several months in the study of

Ewenty-eight used glasses, but thirty-five, including gynecology under Dr. Emmet, and afterwards went many who used glasses, were reported to have been to San Francisco and organized the California State in the enjoyment of good sight. Hearing was good Woman's Hospital, of which he was chief surgeon. in twenty-two, indifferent in seventeen, bad in nine. Though not a voluminous he was a good writer, a genial companion, and a honor to his profession.

> Mississippi Valley Medical Association.—The next meeting of this Society will be held at Crab Orchard Springs, Ky., in July, 1887. There is every prospect of a large attendance, and the papers to be presented give promise of being of unusual value. Physicians having cases to report should communicate with Dr. J. L. Gray, corner Wabash Avenue and Sixteenth Street, Chicago.

THE INDIANA STATE BOARD OF HEALTH.—The Governor of Indiana says in his annual message: The State Board of Health recommends several ness or failing, generally, seemed to have been about amendments to the present law to increase its efficiency, to extend its jurisdiction over diseases of domestic animals, and to create the office of State Veterinarian. The Board states that as the people become more familiar with the operations of the various organizations, and the objects to be attained, the by some from their occupations. Thirty two did not more popular the law becomes, and the more readily use tobacco; twelve were total abstainers from alco-the rules and regulations of the Board are observed.

PORT PHYSICIAN OF PHILADELPHIA.—The Sanifree beer-drinker, and one "drank like a fish all his tart Netes says: A lively scramble is being made life" when he could, but said also that he could not by Philadelphia politicians for the position of Health get much. - Boston Med. and Surg. Jour., January Officer of the port, which is an office in the gift of the new governor. A singular and noteworthy fact is that not a solitary name has been suggested for ASERTOL: A NEW DISINFECTANT.—This substance the position which stands for a samitary worker. is orthophenol-sulphuric acid, and has been known. They are all political workers. May none of them

THE OSTEOPLASTIC RESECTION OF THE FOOT. as Devised by Wladimiroff and Miculicz.

Read in the Section on Surgery of the American Medical Association, May, 1886.

BY CHRISTIAN FENGER, M.D.,

PROFESSOR OF CLINICAL SURGERY IN THE COLLEGE OF PHYSICIANS AND SURGEONS, CHICAGO: SURGEON TO COOK COUNTY HOSPITAL, THE EMERGENCY HOSPITAL, CONSULTING SURGEON TO THE GERMAN HOSPITAL, FELLOW AMERICAN SURGICAL ASSOCIATION, AMBRICAN MEDICAL ASSOCIATION, OF THE GERMAN SURGICAL ASSOCIATION, OF THE BRITISH GYNECOLOGICAL SOCIETY, ETC., ETC.

One of the characteristics of aseptic surgery is conwhich, in certain cases, modern surgeons resort to member, and of obtaining a clean wound which would mutilating operations. At the present day joints are the following operation, which he carefully studied excised, partially or totally, and portions of the tar- and practised on the cadaver:1 He removed the been thought of.

and is destined still further to lessen, the number of operated March 2, 1871, and published the case on cases in which amputation of the foot above the mal- February 11, 1872. He stated that his patient, a boy leoli is called for. The operation is indicated when of 13, could walk without a cane, and that he walked the soft or osseous structures of the heel are destroyed well with a cane. As this case was published in the so extensively that there is not sufficient skin or bone. Russian language, it was almost as good as lost to left on which the weight of the body can rest. It will the medical profession in all countries except Russia. thus be had recourse to in certain cases in which Pirogoff's operation or Sédillot's evidement cannot be per- of Wladimiroff's case, devised an operation similar formed, e.g., where there is tuberculosis of the body to, or rather identical with that of the Russian surof the os calcis, with or without fistulous openings, or geon.2 As the profession became acquainted with where there is extensive loss of cutis on the heel. In the operation through Miculicz, his name has been such cases Pirogoff's operation is impracticable; for attached to it. At the Eighth International Conto be successful, the posterior half-inch or inch of the gress in Copenhagen, however, Professor Sklifossoffcalcaneum must necessarily be healthy, and the skin sky, of Moscow, stated that Miculic's operation had of the heel must be reasonably well preserved. Cica- been known in Russia for some years past, and that tricial tissue, as is known, is of low vitality; it is un-the idea of forming an artificial pes equinus was due able to endure the pressure and friction incident to to Wladimiroff. Miculicz's case is as follows: walking; it is thinned by "usure," becomes necrotic, and the omnipresent pus microbes gain admittance to ulcer which, destroying the skin, had extended from the denuded tissue.

the operation leaves large cavities, in a patient older foot remained intact. Miculicz incised the ankle than 10 years, the cavities will, as a rule, never fill joint, removed the astragalus and os calcis with the with hone. If the greater part of the spongy sub- integument, and sawed a disc off the scaphoid and stance of the calcaneum be removed with a gonge; if, as Sédillot says, a mere shell of bone be left, the calcaneum will, in many instances, be unfit to walk a decrease of the calcaneum will, in many instances, be unfit to walk a decrease of the calcaneum will, in many instances, be unfit to walk a decrease of the calcaneum will, in many instances, be unfit to walk a decrease of the calcaneum will, in many instances, be unfit to walk a decrease of the calcaneum will be removed with a gonge; and the calcane

upon; it is too weak, its spongy substance is but imperfectly reproduced. In such cases the only operation by which, formerly, the patient could be relieved, was amputation above the malleoli,

In 1872 a Russian surgeon, Władimiroff, read before the Medical Society of Kasan, Russia, a paper on several new osteoplastic operations which he had performed on the lower extremity. Among them he described an operation by which he formed, according to his phraseology, an artificial pes equinus. He had had a case where there was chronic destructive disease of the astragalus and calcancum, with loss of skin on both sides of the lower astragalus joint. The cuboid, scaphoid and remaining bones of the foot were sound. Being desirous of having the patient servatism; this is especially seen in the hesitancy with walk on his foot, of preserving the sound parts of the amputations, and in their endeavors to devise less be likely to heal by first intention, he conceived of sus or carpus are removed in cases where, in former astragalus and calcaneum with the skin covering the days, nothing short of an amputation would have heel, and united the cut surfaces of the scaphoid and cuboid bones with the tibia and fibula; the last two The osteoplastic resection of the foot has lessened, bones he cut just above the malleoii. Wladimiroff

In 1881 Miculicz, of Vienna, having no knowledge

In four months his patient walked the hospital with a running sinus. Dr. Verity re-A few weeks later he walked without the boot and united the skin over the remainder of the bone. The

In order to illustrate the operation I will give the history of my case, and later I will discuss the indications for the operation, the method of performing it, and its results:

Synopsis.—Traumatic injury to the right heel resulting in chronic progressive osteo myelitis and periostitis of the os calcis and the talus of ten years' duration. Osseous ankylosis of posterior talus joint. On the posterior and inferior surfaces of the heel and of Chopart's joints, fibrous ankylosis of ankle- there was an adherent cicatrix, roundish in shape joint. Ulcerative destruction of the skin on the pos and about 11/2 inches in diameter. The centre of terior surface of the heel. Repeated local operations this cicatrix presented a granulating spot where a on the calcaneum without permanent benefit. Ab- probe could be passed to the roughened surface of seess and subsequent intractable fistulas on the dor- the calcaneum. The soft parts around the ankle and sal side of the talus, leading to diseased bone in the on the dorsum of the foot were swollen and indurasinus tarsi. Osteoplastic resection of the foot in ac- ted. An abscess on the dorsal side of the astragalus cordance with Miculicz's description. Consolidation was opened and about a tablespoonful of pus evacof the foot in good condition. No relapse of the dis- uated. The probe discovered roughened surfaces of ease in the hone; forcible extension of the toes into bone in the sinus tarsi. I drained the abscess, placthe equinus position. Rupture of skin at the base ing a tube transversely behind the flexor tendons; of the first phalanx of the hallux. Subsequent in scraped the granulating spot on the heel and applied tlammation of the scar. Excision of the scar and an iodoform dressing. The wound was treated for transplantation of skin from the planta pedis. Heal four months with injections of tineture of iodine and out cane, and can bear the whole weight of his body remained the same it became necessary to decide on right foot.

patient followed the occupation of a sailor. On board ber 31, 1884. ship he received an injury in his right heel from a

cuboid bones. The steps of the operation were as tenderness around the os calcis and its articulations. without a cane in a boot constructed for the purpose. moved part of the os calcis, excised the cicatrix and was able to bear his whole weight on the resected wound did not heal; six months after the operation an abscess formed on the dorsum of the foot over the astragalus.

Patient now passed into my care. I found him pale and poorly nourished; lungs, heart and abdominal organs healthy; urine normal. The right foot was fixed in plantar flexion at an angle of about 30°. There appeared to be complete ankylosis in all the joints from the ankle to Chopart's articulation. ing by first intention. Patient is able to walk with of a solution of iodoform in other. As the condition whether the foot should be amputated above the Christian Jebsen, et. 28, laborer, gives the follow: ankle or resected according to the method of Micuing history: His father was troubled for many years liez. The loss of skin on the heel and the diseased with annually recurring attacks of facial erysipelas; condition of the bone put Pirogoff's operation out of his mother suffered from a chronic pulmonary dis the question. As the patient wished to retain as ease and varicose ulcers of the left leg. Patient's much of his foot as possible, I determined on Micuhealth was good up to his 18th year. At that time liez's operation, which I performed upon him Decem-

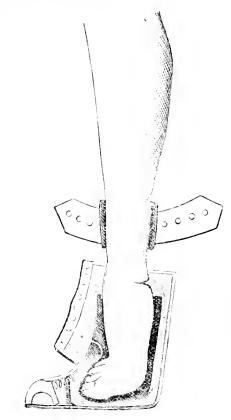

After thorough disinfection of the foot and leg as pointed iron rod which was thrown at him by the high up as the knee, patient was anæthetized, turned captain of the vessel. The point of the rod entered over on his stomach, and Esmarch's elastic bandage the os calcis posteriorly and passed forward and applied. As there had been an abscess on the dorsal downward for about one half inch. The wound sup-purated one year, during which time patient was in erable infiltration of the tissues around the flexor poor health. He was confined to his bed most of tendons and in the neighborhood of the arteria dorthe time. Two months after closure of the wound salis pedis, I dared not rely upon this artery alone the cicatrix opened; this, together with swelling and for the blood-supply of the foot. I desired to pre-

serve the posterior tibial artery as far down as I pos- foot was perfect; after removal of the elastic conthe internal and external plantar arteries. I was peripheral side of the wound. consequently compelled to make my incisions some-From this point I curved my knife, cutting down to caused no further trouble. the bone, backwards and upwards over the internal surface of the os calcis, below the sustentaculum tali, to the inner border of the tendo Achillis; thence npwards along the tendon to a point posterior to the ankle joint. In making my external incision 1 commenced one inch behind the tuberosity of the fifth metatarsal bone in the margin of the foot; I then cut upwards and a little backwards, running the incision half an inch anterior external malleolus, over the external surfaces of the processes anterior calcanei and the body of the astragalus to the ankle joint. Between the upper and lower ends of these incisions 1 made transverse incisions across the sole and behind the ankle joint respectively, cutting down to the bones. The superior transverse incision dividing the tendo Achillis, gave a ready access to the ankle joint. The soft parts of the dorsal flap were detached from the subjacent bones with a periosteal! elevator, which was kept between the periosteum and bone in order to avoid injuring the vessels. The disarticulation at the ankle joint was accomplished with some difficulty, as a complete osseo-fibrous ankylosis was found to exist between the astragalus and the tibia. Having disarticulated, I pushed the heel downwards and further detached, with the periosteal elevator, the anterior soft parts from the astragalus. From inactivity and the proximity of a suppurative inflammation, the bones had undergone fatty atrophy (adipose osteoporosis); they were so friable as to break in or near Chopart's joint, which was completely ankylosed. The posterior parts of the scaphoid and cuboid bones were now gouged away as far as diseased; after healthy bone was reached a thin disc was sawed off each bone in order to obtain even and smooth bony surfaces. The ends of the tibia and and the necessary drainage was provided for. The contracted. plaster of Paris bandages.

The latter oper-following manner: ation does not alter the position of the foot, it allows the patient to walk on the planta. Opinions differ rior transverse incision may be begun three-fourths in regard to this question. Most of the older writ- inch external to the tibial border of the foot. The ers, as Hueter, Koenig, Czerny and Billroth, advise tibial incision may then be made from this point, not against resection of the tarsus. Lately, however, upwards to the internal malleolus, but almost hori-Kappeler in Germany and Connor in America have zontally backwards over the tibial surface of the os taken up and, in able papers, revised the subject of calcis, below the sustentaculum tali, to a point one resection of the tarsus; both come to the conclusion inch posterior to the sustentaculum; then it may be that a good functional result may be obtained after continued upwards along the tibial border of the removal of the tarsus, even when the operation is tendo Achillis to the posterior side of the ankle joint. combined with a resection of the ankle joint, i.e., By this incision we may hope to save the internal with a removal of the lower ends of the tibia and plantar artery, whose assistance in supplying the foot fibula. It may thus be doubted whether such cases with blood seems essential. This low incision is as the thirteen mentioned call for Miculicz's opera-somewhat inconvenient to the operator; he meets tion, and whether his second indication is not better with greater difficulties in getting at the ankle joint met by a partial, or even a total resection of the and Chopart's articulation than he does when Micu-

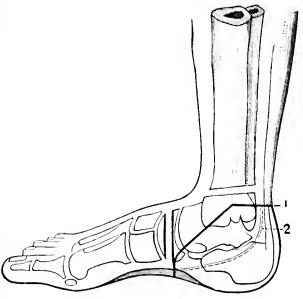

as appears to me, must be indisputably accepted as osteally from the calcaneum and astragalus with a good. Where there is extensive ulceration of the periosteal elevator (flat gouge), partly by bringing skin covering the heel, nothing but a cicatrix will the external or fibular incision more upward toward form, and a cicatrix under the heel cannot bear the the dorsum of the foot, so as to have it terminate weight of the body, and will always ulcerate under about one-fourth inch anterior to the external malthe pressure it is subjected to in walking. As both leolus. This incision does not imperil the safety Syme's and Pirogoft's operations require that the skin of the anterior tibial artery. The upper and lower on the posterior flap be healthy, the osteoplastic retransverse incisions will be about of the same lengths section of the foot is the only operation by which a as they are when Miculicz's directions are followed; supra-malleolar amputation can be avoided.

If, in the course of time, the osteoplastic resection joints. of the foot should prove superior to excision of the tarsus, to Syme's and to Pirogoff's operations, in its functional results, the indications for the operation will be viewed in a different light.

Steps of the Operation—1. Incisions. — Miculicz | made a transverse incision across the sole from the tuberosity of the scaphoid to a point a little behind the tuberosity of the fifth metatarsal bone. Schattauer cut one fourth to three-fourths inch anterior to this, running his incision over the cunciform and cuboid bones. From the ends of the transverse cut incisions were made on the tibial and fibular sides of the foot, upwards and backwards as far as the malleoli, between which two points the knife was carried around the ankle joint posteriorly. The tibial incision from the tuberosity of the scaphold to the internal malleolus inevitably divides the posterior tibial artery, or rather its plantar branches. This leaves but the anterior tibial artery to supply the foot with blood. Miculicz, before he did his first operation, doubted that the blood-supply of the foot would be sufficient. He was, however, relieved of his anxiety when, after the removal of Esmarch's bandage, he saw the cut ends of the plantar arteries bleed freely. As I said above, I likewise feared for the safety of

As to the first indication it is to be remarked that my patient's foot, in which there existed fistulous such apprehension was well founded may be seen The second indication has most frequently led to from Sordina's case, in which, four days after the

Instead of cutting clear across the planta, the antelicz's incision is made. This difficulty, however, is Miculicz's third indication is the only one which, overcome partly by separating the soft parts subperithere will be sufficient working space to get at the

Four months operations were not respectively indicated. after a typical Miculicz operation, Kummel took away pieces of the tibia and fibula. The wound healed by conclusions: first intention. In five weeks his patient was able to pain. In Fischer's case the tuberculosis returned results superior to those of supramalleolar amputation. eight months after the operation. He removed what remained of the cuboid and the second and third indisputable indication for its performance. cuneiform bones. His patient walked in a boot, with

15, 16), six to seven months. Prognosis and Results.—As yet there has been no final functional results. death attributable to the operation. Two patients died of pulmonary tuberculosis, one six and one eight between the osteoplastic resection and the operations months after the operation (cases 4 and 8). Both of mentioned, for the purpose of determining its value these patients had walked on the foot, and, conse- as compared with that of the older operations. quently, the operation may be said to have been successful. Three of the operations published were failures, as amputation above the malleoli became necessary. In two of these cases the disease relapsed (6 and 1.4), and in one gangrene of the foot set in (17). The patients, however, did not die.

It is thus seen that the osteoplastic resection of the foot is not attended by greater danger than the other operations in this locality. As the nineteen operations published were done with antiseptic precautions, it would, of course, be rash to conlude that the excision of the tarsus, or of Pirogoff's or Syme's operations. The statistics of the latter operation unloubtedly owe their death-rate to pre-antiseptic

It cannot be said that the final, functional result of the operation has, as yet, been well ascertained; most of the cases were published a relatively short time after recovery from the operation, and Fischer rightly remarks that we cannot judge of its value before we have a large number of cases before us. The object of the operation is to enable the patient to walk on his foot without any pain; to enable him to bear the whole weight of his body on the walking-surface. This object was accomplished to perfection in three cases (2, 3, 13), and fairly well in nine. In this respect the results of the operation are far superior to those of supramalleolar amputations. It is Fischer's opinion that Miculicz's operation gives better results than Pirogoff's, because after the former the walking surface is at least one-third larger than after the lat-

as four or six weeks after the operation, and that they ter, and because the toes give a certain "elasticity" to the gait. Closer comparison of the results of the A far more serious occurrence, during the after- two operations is as yet needed to confirm the cortreatment, is a relapse of the tuberculosis, either in rectness of this opinion. Miculicz did not intend the bones or in the soft parts, but especially in the his operation to take the place of Pirogoff's or The tuberculous tissue must Syme's, although it seems that in some of the nineat once be removed. That an extensive secondary teen cases reported the question might have arisen operation may be done and the final result still be whether excision of the tarsus, or Pirogoff's or Syme's

From the facts which I have collected and stated the tarsus, part of the metatarsus, and additional above I think it is justifiable to draw the following

THE ETIOLOGY AND CURE OF ASTHMA.

Read before the Chicago Medical Society, January 3, 1887. BY EDWIN J. KUH, M.D.,

SPROBON TO THE MICHAEL REESE HOSPITAL, CHICAGO

The work of Wilhelm Hack on the radical treatment of migraine, asthma, hay fever and other neuroses, has received very inadequate recognition in this country. By writers on hay fever he is frequently quoted in an offhand manner together with a string of other authors; so that one derives the impression that few of those who quote him have read him. And if his specialistic colleagues do not do him justice, the large class of general practitioners ignore him almost altogether. His work is-taken altogetherof even greater interest to the physician than to the specialist, and it is a deplorable consequence of specialistic exclusiveness, that the results of his work have not yet received wider recognition among us. He teaches us that the rhinoscope must forthwith be as indispensable an instrument for all physicians as or by bulbar irritation, or by exudative bronchiolitis. the thermometer and stethoscope.

The value of Hack's discovery, that asthma nervosum is a reflex disease with, usually, the nose as a starting-point, can best be appreciated by one who himself, for many years, struggled against the disease and fumed at the utter impotence of medical art to stave off the attacks. If I, therefore, in the course of this paper, class myself among my own patients. I shall do so with the view of bringing the subject within closer range. It is foreign to my subject to consider the isolated publications, from Voltolini downward, on the dependence of asthma upon polypous growths in the nose. Such cases are infrequent enough to be almost considered curiosities (Michel, for instance, reports 135 cases of polypus without asthma); and as Hack shows, polypi have rather a tendency to prevent asthma than to cause it. It will also simplify our subject, if we omit hay fever from this were the case, he reasoned, then perhaps the imour consideration.

The form of asthma of which I wish to treat exclusively is that perennial form which is more or less independent of the seasons, namely: asthma nervosum, or "Essentielles Asthma" of the Germans. Some persons never get beyond a slight hint of asthma. without palpitation, or of sudden drowsiness, or dream heavily at night and complain of dulness, lassitude only of a fleeting, leaden heaviness in the limbs amounting almost to pain; the same sensation of which so many true asthmatics complain after an asthmatic night. The typical asthma nervosum is known to us all as a neurosis occurring in paroxysms.

The patient may or may not feel an aura. He will generally, towards evening, or when he lies down, or awakes in the night, begin to wheeze. This wheezing may be associated with itching in the nose, or sneezing, or coughing; the attacks last an indefinite time, and generally end with the expectoration of a transparent glassy mucus. Such patients are often free from asthma during the day. Physical and chemical irritants, such as dust, sudden changes in temperature, the inhalation of certain gases, and a long series of idiosyncrasies which we find enumerated in textbooks, can induce an attack. But the recumbent position is the most uniform exciting cause of the single paroxysms. Such patients may be free from chronic bronchitis, chronic emphysema, heart-, kidney-, intestinal- and uterine disease: hence the term "Essentielles Asthma."

When we read authors whose contributions to the study of asthma antedate the last few years, we are struck by the uniformity with which they cling to a pet theory, each of which seems to give satisfaction to its upholder. It is merely an evasion to say that asthmatic paroxysms are induced by bronchial spasms, or by hyperæmia of the bronchial lining, or by the presence of Leyden's crystals, or by phrenic spasm, For any one of these presumable causes would demand a first cause, in order to merit etiological dignity.

A true etiology of asthma had therefore to be discovered, and Hack did it in the following manner: He knew, of course, of the occasional rôle of nasal neoplasms. Schäffer and B. Fränkel had also indicated that the sensibility of the nasal lining could be so heightened through chronic catarrhal conditions, as to be a starting point for reflex disturbances. Then Hack found that he could experimentally produce glottis-spasm by touching the turbinated bodies of a sensitive individual with a probe. He then reasoned as follows: A nasal mucous membrane which shows merely slight affection, and which is not deadened in its sensibility by thickening and hypertrophy, is perhaps a better surface for exciting reflexes than one which shows evident signs of disease. And if portance of nasal reflexes had been formerly overlooked just because of the insignificant abnormities of such a sensitive nose.

The very frequency of certain conditions may have given rise to an under-estimation of their significance. And so Hack systematically examined the nose of They will from time to time make a heaving, sighing every patient who, for whatever ailing, came within motion, or complain of praccordial fulness with or his reach. He learned to make one distinction very rapidly, namely: that what is usually termed hypertrophic nasal catarrh is a twofold condition, which in and headache in the morning. This latter condition its effects is quite opposite. In the anatomically true has many gradations, the culmination of which is rhinitis hypertrophica the mucous membrane is really nightmare. In the future we must, therefore, learn thickened, hypertrophied through chronic inflammato distinguish between an incubus of gastric and of tion. Pressure with a probe meets with a certain

Others again the os and found it more soft and was enabled to inmay relapse with a new reflex sensitiveness in other sinuate my index finger, and by careful pressure with my left hand over the fundus uteri I could distin-But on the whole the subject, still so new, still so guish the head presenting. To satisfy myself as to capable of growth, broadening and development, is the true character of the pains I remained at the one of the most pleasing contributions to medical bedside; the pains were irregular, sometimes severe, knowledge, and the name of Hack will be, I am again they would be but slight. I examined the condition of the os uteri during the period of the pain, and found that the pains had no effect upon the cervix which remained undilated and flaccid, and the membranes did not become prominent or tense. The bowels had moved early in the day and a light meal taken at 12 M. Advised the continuance of the anodyne at once and again in two hours. This would control the severity of the pains and would lessen the rigidity of the os.

11 P.M.—Found the patient suffering true labor pains, pain in the back, the os soft and dilated to the On the morning of August 5, 1886, I was called to size of a twenty-five cent piece; the head at the labor was much the same, and was what would be termed a tedious labor; the liquor amnii having all fered six miscarriages. Professor Daniel T. Nelson, escaped with the so-called hæmorrhage and each ex-

that the antiseptic system is founded upon specula- lected and interpreted. Dr. Foster claims "distion pure and simple; and, furthermore, that this tinctly that in epidemics of puerperal fever there are antiseptic system, as a routine practice, is, in its es- occult epidemic constituents of atmosphere, either

sary and frequently harmful to the lying-in woman." Journal of the American Medical Association. And "the facts upon which the argument is based are taken almost exclusively from writers who are, or have been, advocates of the antiseptic system." In opening the argument on this question he first proposes to consider the theories as to the essential nature of puerperal fever, each one of which, he says, "is a matter of unadulterated guess-work." He does not discuss the question from the stand-point of labor in hospitals, but in private homes; for he says: "There is no analogy whatever between puerperal fever in private practice and hospital experience as to the modes of infection and the necessity of prophylaxis." If this be true, why apply hospital statistics to those of private practice? Why reason in private practice from hospital experience? If filth can cause disease in a hospital it can do the same thing in a private house; if it cannot cause disease in a hospital it cannot in private practice. If, as Dr. Foster says, labor is a purely physiological process, it is as There still seems to be some who do not recognize much so in private practice as in a hospital, and the difference between a "Lister dressing" and "List vice versa. It need not be said that private homes terian principles." It does not seem sufficient to say are in better sanitary condition than hospitals; for if that the dressings may change but the principles can- antiseptic principles be unscientific then filth has not, as this has been repeatedly pointed out during nothing to do with the matter. If not, we cised by the leading obstetricians of the country at may as well attribute puerperal fever to volcanic the time; and Dr. Foster now takes up the rules therein laid down seriatim. He ridicules the propo-The attempt to prove "that even in hospitals the sition to disinfect the lying-in room before labor, for antiseptic methods have been unsuccessful" may be the remarkable reason that if there are any germs attributed to a confusion of terms; to the idea that they must have come from the atmosphere, and that antisepsis, or asepsis, consists in carbolic sprays and it is impossible to disinfect the atmosphere of an ocinjections of solutions of certain disinfectants or cupied room. With regard to the rule that nurses germicides. Where asepsis is complete antisepsis is and physicians should take care that all their clothunnecessary. Obstetricians will no doubt be sur- ing is free from exposure to the effluvia of septic inprised to learn that the author takes the statistics of fection, such as typhus fever, erysipelas, etc., Dr. the Rotunda Hospital and the Vienna Maternity to Foster says: "To this rule I have no objection, so prove that antiseptic methods are unsuccessful; but, far as it is intended to protect the lying-in woman on investigation, it is found that he does not recog- from zymotic diseases. If, however, it is intended nize that absolute cleanliness is the great antiseptic to contend or intimate that the poisons of scarlet precaution. He does not mention the fact that the fever, measles, variola, etc., can produce puerperal Rotunda Hospital is one of the best ventilated hosfever, I most unhesitatingly deny the proposition." pitals in the world; nor does he seem to realize that So far as the woman is concerned it is perhaps imgood ventilation is an antiseptic precaution. He material with her whether she die of puerperal fever declares that antisepsis has had nothing to do or scarlet fever; and the fact (if it be a fact) that with the good results at the Preston Retreat, scarlet fever cannot produce puerperal septicæmia is under Dr. Goodell, and then quotes Dr. Goodell: no argument against antiseptic precautions and "I am governed by four golden rules-clean principles. The rule which prescribes that the phyliness, ventilation, rotation, and isolation!" Are sician should wash his hands in soap and water and not these antiseptic precautions? As against anti-| scrape the nails, and afterwards use a solution of septic principles he quotes some statistics from the bichloride of mercury, is criticised by quoting the New York Maternity Hospital (from 1875 to 1882, experiments of Förster, which showed that solutions of inclusive). He then says that in the autumn of 1883 carbolic acid, boracic acid, zinc and iron chlorides do Dr. Garrigues overhauled the Maternity, and insti- not sterilize the hands; but in the same paragraph he tuted new antiseptic measures (which may be found quotes Forster to the effect that the hands were sterilin Lusk's Midwifery, p. 689, footnote); but he does ized by the use of a solution of corrosive sublimate of

ples. Certainly it is no argument to quote statistics to see that such men have the advantage of others of a hospital which used details and neglected first in experience. Intelligence without opportunity principles, as does Dr. Foster in the case of the will not show the usefulness or worthlessness of principles or details. The fact that an Indian woman

foot of Mt. Hood, does not have puerperal fever is Chicago. As it is very desirable to derive as much insufficient proof that a woman confined in the benefit from the expense and time already bestowed Vienna Maternity can not have it; nor does the fact in printing and distributing the collective investigathat a woman may be injured by repeated vaginal in-tion blanks, and equally desirable that the work in jections show that she cannot possibly contract this country should not prove a failure, we wish to puerperal fever when confined in a filthy room, at- add to the request of Prof. Jacobi by urging that all tended by a careless physician. Among other hon- those who have blanks with recorded memoranda ored members of the profession Sir Joseph Lister would return them as promptly as possible to the comes in for a large share of Dr. Foster's ridicule, address already given above. Lister's contribution to medicine does not lie in the fact that he invented a spray for throwing carbolic acid vapor; not in the fact that he once used cheesecloth; that he made a metallic case for keeping surgical needles in carbolized oil—but in his system, his principles, of antiscptic surgery; which principles, not details, have been successfully applied to midwifery. The truth of principles is not proved by any one set of details; but Lister's principles have been shown to be true because they hold good under any and all details in which the principles are adhered to. Even the once hated and despised, but now honored Semmelweis comes in for a share of the ridicule which Dr. Foster attempts to heap upon members of the profession who have worked, and are now working for the good of humanity.

INTERNATIONAL COLLECTIVE INVESTIGATION OF DISEASE.

During the session of the Eighth International Medical Congress in Copenhagen, 1884, an International Collective Investigation Committee was organized, composed of representatives of Sweden, Norway, Denmark, Finland, Russia, Germany, Austria-Hungary, Switzerland, France, Great Britain, India, the United States, and South America. The two representatives on the Committee for the United States were Professors A. Jacobi, of New York, and N. S. Davis, of Chicago. Under the personal supervision of Prof. Jacobi a large number of the blanks for making returns adopted by the International Committee were printed in a neat and convenient form, and distributed to members of the profession in different parts of this country. Those receiving them were requested to fill up the blanks in due form with such cases of the several diseases as should come under their observation, and return the same to Professor Jacobi, on or before the 1st of January, 1887. A few weeks since he gave notice, through the medical journals, that he had resigned his position on the

PRESENTATION TO DR. N. S. DAVIS.

On Thursday, January 20, the fiftieth anniversary of the entrance of Dr. N. S. Davis into the medical profession, he was presented by the students of the Chicago Medical College with a magnificent arm chair and a valuable and beautiful revolving set of reference shelves. The presentation was made by Professor W. W. Jaggard, in behalf of the students, and Dr. Davis responded in a most graceful manner. It has been but a few weeks since Dr. Davis's seventieth birthday was celebrated at his house by a large number of his friends.

It is peculiarly fitting that the students of the College of which Dr. Davis is practically the founder, the College which represents the principles of higher medical education for which he did so much before its foundation, and has done so much since, should have taken some note of his fiftieth birthday into the profession. Indeed, the American Medical Association is the outgrowth of Dr. Davis's earnest endeavor to raise the standard of medical education in this country. Ε.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, January 3, 1887.

THE PRESIDENT, EDMUND J. DOERING, M.D., IN THE CHAIR.

Dr. E. J. Kun read a paper on

THE ETIOLOGY AND CURE OF ASTHMA.

(See p. 121.)

Dr. J. A. Robison, in opening the discussion, The facts, which are indeed facts, that have been related in this paper are of interest not only to the specialist but to the general practitioner. It has been a fact long known to specialists that obstruction of the passage of air through the nares will give rise to asthma, and a great number of articles Committee, and requested those interested to make have been written on this subject. It has also been their returns to the other American member of the demonstrated that when operations have been perthat transitory swelling which takes place in the last year. turbinated bodies in cases of mild irritation. I prewith an acute corvoa and go to bed at night the flex asthma or something different? narium of the side on which we lie becomes obcurrence of the asthma.

very great extent. My experience, however, was the eschar. somewhat different from Dr. Kuh's as the cauterizathough once in a while I still suffer from coryza.

formed that cleared away these obstructions the re-decidedly polypus of the nose has caused asthma, liet from the asthmatic attacks was complete. This and where by the use of the polypus the asthma was can be easily demonstrated by any physician, cured. I can confirm what Dr. Kuh has said in re-Cases of nasal polypus are quite frequent and they gard to the effectiveness of the galvano-cautery. I do not always fall under the care of a specialist. had a case of a boy 12 years old, who had nearly all The operation is generally a very simple one, almost his lifetime had chronic eczema of the hands and any physician, without special training, can remove asthma. Believing that the asthma was in causal renasal polypi, and it is really wonderful to find how lation to the eczema, I referred the patient to Dr. many cases of asthma are thus cured. As to asthma Kuh for treatment of the former trouble, while I pre being due to other causes, I have no doubt of the scribed local applications for the hands. Very soon truth of the observation made by the author, that is both affections were cured and have remained so for

PHILADELPHIA COUNTY MEDICAL SOCIETY,

Stated Meeting, January 12, 1887.

THE PRISIDENT, J. SOLIS COREN, M.D., IN THE

Dr. H. A. Wilson is ad on behalf of Dr. John B. Roberts the report of

A CASE OF SUPRAPURE TITHOTOMY, FOLLOWED BY DEATH FROM PERFORATING CICER OF THE

STOMACH.

The following case of removal of stone from the urinary bladder by the suprapuble or high operation, is reported as proving the position which I have so long insisted upon, that this operation is easily accomplished, and is free from many of the dangers of the lateral perincal operation.

C. H., aged 63, applied to me for relief from frequent urination, and other bladder symptoms, and was sent to the wards of the Pennsylvania Hospital. Upon the introduction of the lithotomy sound, it was mine was drawn from the bladder, apparently provgland. The patient was a very fat man, with poor circulation, and evidently a bad subject for etherization or operation. The urethra was large and easily distended. It therefore seemed to me proper to attempt the removal of the stone by the rapid crushing method.

With this object in view, I had him frequently dilated with large bougies, in order that the urethra and That point is the persistence of bands, or stumps of bladder might become tolerant to the contact of inbands, of the more resisting tissues which remain, struments. Subsequent to this preparatory treatsometimes passing across the cavity. As the fibrous ment, I made an attempt to crush the stone with a tissues are more resistant than the others in the lung lithotrite, expecting to evacuate the fragments by the they are the last to disappear in the necrotic process, ordinary method of Bigelow. Repeated efforts proved In this specimen there are a few cavities in the apex, the impossibility of seizing the stone, either because some of them large, and the tubercular infiltration it was too large to fall into the grasp of the blades extends entirely to the base of the lower lobe of the of the instrument, or because it was encysted behind right lung. There was extensive adhesion of the two the prostate gland. Even with a finger in the rectum, and with the jaws of the lithotrite turned downward,

As the man's perineum was deep, and as I believed that the perineal operation was inferior to the supra-Dr. Wing said: A cavity resulting from bron- public one, because of the liability of hæmorrhage, of

After etherization, a rubber bag, to which was atat other times long, and at times, as in this case, they tached a long tube, was placed in the rectum, and filled with about twelve ounces of warm water. The bladder was afterward filled with 6 or 8 ounces of a weak solution of bichloride of mercury. A three-inch incision was then made in the median line through the skin and a depth of nearly two inches of adipose tissue. The muscles were then separated, and the tissues torn through with my finger until I came upon the distended bladder. By means of a curved needle I passed a string through the top of the bladder, and brought both ends out of the wound to serve as a

handle by which the bladder could be held up close wound in the abdomen was almost closed. He had to the surface. A longitudinal incision of about an no trouble in urinating, and was very comfortable, inch in length was then made in the anterior wall of except for the epigastric pain and the great weakness. the bladder from above downward. The water imtroduction of my finger I felt a large flattened stone perforation of the walls of the stomach, and had lying in the lower portion of the organ, but not en-allowed its contents to escape into the peritoneal cysted. After some little difficulty the calculus was cavity. The cause of the vomiting of blood, of the seized in ordinary lithotomy forceps and drawn out impaired nutrition, and of the constant pain which of the bladder, the wound in which was then closed he suffered for many weeks before his death, was, brought together by buried sutures of catgut, and ent before the time of operation, but latent in regard the integument subsequently closed in the same man- to symptoms. ner. A drainage-tube was carried in at the middle tween the anterior wall of the bladder and the pubic rectum and bladder by the fluid forced into them prebone. The edges of the wound were finally sprin-kled with powdered iodoform, and the ordinary anti-septic dressing of gauze and corrosive sublimate bladder wound and early restoration of the functions applied. No person shall add to or remove from mater by trephining, provoke with certainty the same by inoculation under the dura mater. 8. The fixed Sec. 11. All suits for the recovery of the several virus does not seem to undergo by ulterior transmispenalties prescribed in this Act shall be prosecuted in sions a notable shortening of the period of incubathe name of the people of the State of Nebraska, in tion, the malady sometimes commencing after six any court having jurisdiction, and it shall be the duty days. On the other hand the period of incubation of the prosecuting attorney of the county where such of seven days is not constant, as it is sometimes prooffense has been committed, to prosecute all persons longed to eight, ten, and even twelve days. One may also obtain a period of incubation of from eight to twelve days, and consequently a virus of the same virulence as that of the fixed virus, by the transmission of street rabies, and that occasionally from the second or the third generation. 9. The procedure indicated by M. Pasteur to obtain a fixed virus of a use of injections of cocaine in minor surgery, for period of incubation of seven days, is perhaps not producing complete local anæsthesia by injecting the only one, as the said virus may sometimes be into the part, through a fine needle, one or two drops obtained much earlier, independently of the trans- of a four per cent, solution of cocaine. For this missions, and this virus is constant in its effects and purpose I use the thinnest steel needle procurable in its period of incubation. 10. The virulence of a very delicate needle sold by Tiemann & Co., which portions of the spinal marrow diminishes from one they bill as "Green's." day to another by dessication at 20° centigrade over. My experience leads me to think that some of the caustic potash, and is completely destroyed after a surgeons using cocaine for local anæsthesia inject dessication of twelve or fourteen days. 11. Animals more than is necessary. Its local action, as I have that have been subjected to subcutaneous injections observed it, is anæsthetic and anæmic. When inof a series of attenuated inoculations (by more or jected it causes much more local congestion and irless lengthened dessication), are rendered refractory ritation of the integument than morphine. It greatly to the stronger virus by the previous inoculations aids morphine to relieve any form of neuralgia, eswith the weaker virus, if the stronger virus have not pecially facial, and migraine. Is it the hydrochloric been used in too rapid succession. 12. Animals acid that chiefly causes the local irritation? Is the which have been inoculated subcutaneously during plain drug cocaine less irritating than the hydrochloten days with virus of progressive virulence (spinal rate, benzoate, etc.? I cannot answer from expemarrow from ten days to one day) have not been rience. A full dose hypodermically-gr. ss-j, often refractory to infection with the fresh virus of "street much less-will cause quite free sweating, and frerables," and have only exceptionally escaped after quently a momentary sense of painless dilatation of intra-cranial infection. 13. Rabbits and dogs infected the heart, a peculiar feeling, like that sometimes felt after trephining with the virus of street rabies of six- in the beginning of syncope. I believe its effects teen days' incubation have, without exception, suc- are toxic in most cases when more than one-half cumbed, notwithstanding the preventive treatment grain is given hypodermatically, although the dose, already described. 14. M. Pasteur attributed to the as of other drugs, varies in effect according to temmethod of slow vaccinations the unsatisfactory results perament, use, state of system, etc. obtained previously by M. von Frisch, and recommended a more rapid procedure. The experiments on my own person, for the relief of intense neuralgic animals died of rabies. 15. These experiments have medicine being injected under the skin, as usual. not confer the same certainty of immunity against peared to be quite devoid of sensibility. the stronger ones of a series of dogs and rabbits, to in the preceding paragraph, and in which the rapid finger, which he had pricked slightly, with a needle, process was carried out without previous infection, during an amputation of a gangrenous finger the day most of the animals died of rabies. 16. Most of the before. It was decided to incise the finger, freely, animals which were submitted to the preventive to the bone, to relieve tension, and he sat there incubation was thirty-four days.

M. von Frisch asserts that these experiments show to try it. that M. Pasteur's method of rendering animals refractory to rabies is, as yet, not quite certain. There is of the finger, into the skin only, two drops of the not yet a sufficient scientific basis for the application cocaine and morphine solution. A moment later in man of a preventive treatment after the bite of a the doctor deliberately plunged his bistoury down rabid animal. Moreover, it is quite possible that by through the periosteum and cut outwards, making a the preventive treatment itself, at any rate by the gash in the skin eight lines in length. He cut as derapid procedure recently recommended by M. Pasteur, the malady itself may be transmitted. In taking instead of himself, never wincing in the least, and a glance over what precedes, it will be seen that the exultingly exclaimed that it did not hurt at all. conclusions 1, 2, 4, 5, 6, 7, and 10 only concord with those of M. Pasteur.

Fluid dentifrices do not, as a rule, clean the teeth effectually, unless they contain some ingredient which acts upon the enamel itself; and those preparations which are eulogized as making teeth white or preventing the deposit of tartar, should be avoided. Charcoal was at one time a very popular form of dentifrice, and is even now largely used, but from the amount of silica it con-TENNESSEE STATE BOARD OF HEALTH.—The Gov- tains it will rapidly wear away teeth that are not of ernor of Tennessee pays a well deserved tribute to exceptional hardness; and, moreover, the gums in

said to make the gums spongy. Precipitated chalk forms the best basis for a tooth powder, to the base of which may be added pulv. saponis and ol. eucalypt., a drachm of each; and, if there is no objection to the taste, half a drachm of carbolic acid.—Lancet, January 1, 1887.

Necrological.—The members of the Council of the New York State Medical Association, while humbly submitting to the decrees of Providence, realize with much grief that the year now closing is made notably sad in the loss by death of so many of their Fellows whose labors have largely contributed to the honor, dignity and usefulness of the medical profession. They now mourn the loss of the second Pres- of hysterical attitude. ident, Dr. John Perdue Gray, whose aid, wise councils, and personal work have been of such signal sociation, and with the medical profession at large, they sorrow for the death of one who had rendered himself so useful to the State in the guidance of the Dr. Philip T. Harvey, U. S. Army, has been apcharitable work in the department of medicine in pointed to fill the vacancy. which he had become a shining light. The Council, therefore, resolved, that the above be published in the forthcoming volume of the Transactions of the Association, and in the medical journals, and that a copy thereof be transmitted to the family of the deceased, more than eight hundred items. E. D. Ferguson, Secretary.

January, 1887.

DISINFECTION OF CABS.—At the meeting of the Society of Medical Officers of Health, on Nov. 19, the Council advised the following method of disinfection: The cushion and as much of the internal fittings as are movable should be taken out of the cab and put in a disinfecting oven, where such is available; if there is no disinfecting chamber, the cushions, after having been taken out, if movable, them on end so as to expose both surfaces to the action of the chlorine gas which is subsequently used. All exposed woodwork on the inside of the cab should be washed with carbolic acid soap; and carbolized oil should be smeared over the metal work, with the view of disinfecting it, and protecting it from the action of the chlorine. Chlorine gas should be evolved inside the cab, and the cab shut up and kept exposed to the fumes for one hour.—British Medical Journal, Jan. 1, 1887.

Dr. Charcot.—George Augustus Sala says: Dr. Charcot is surely one of the most ingenious of medical mankind. He is a specialist in hysteric and hypnotic cases, and I read that, having satisfied himself

I removed the covering and made a carein a chair, holding his arm so that the elbow was ful examination of the shoulder, both by touch and about five inches from the side of the body. He sight. I could discover no abnormality of shape or stated that that was the most comfortable position he position. Though voluntary motion was in a degree had found. Upon removing his clothing it was easy lost, the left arm could be placed in any position to see that the head of the humerus was absent from into which the right one could. The motions of the its usual place. On account of the thick clothing arm revealed no sign of fracture. Now, however, I which he wore at the time of the accident, there was found what I had not found before, namely: that no indication of bruise apparent. I made no meas-pressure just below the end of the coracoid process urements, but I thought the injured arm was slightly gave crepitus. Pressure upon the coracoid process longer than normal. The acromion and coracoid did not produce crepitus. I therefore changed my processes were very prominent. Under them was a diagnosis from simple dislocation to fracture of the cavity. The upper extremity of the humerus did not anatomical neck of the scapula, and directed that the stand out further than, if as far as, a perpendicular elbow be bound to the chest and that the forearm be

That night the arm was not bound to the chest as ering any abnormality. The clavicle was in place directed. In the morning the patient found his and entire. I could feel the head of the humerus in shoulder not quite so easy, but thought it not strange, the axilla. There was no tumor under the coracoid 11e thought in the night during his sleep he turned process, nor under the spine of the scapula. I could and lay for a time towards his injured side. He had find no crepitus anywhere. Though the elbow did a dim memory of something of the kind. After getnot stand out prominently, and though it could be ting up he happened to sneeze, and at that time he brought to the chest, I diagnosticated the case as one felt a slight jar of the shoulder. Immediately thereof simple subglenoid dislocation of the head of the after his joint became more comfortable. Two days later he had a repetition of the uncomfortable feeling

January 14. 1886.—I found some ecchymosis of and strong and not relaxed by drug or drink, I anti- the left arm and chest. Arm doing well. The head

of the humerus seemed to me a very little forward and below its natural position. No special soreness in the shoulder joint. Pressure towards the body upon the head of the humerus did not produce pain. Pressure below the tip of the coracoid did produce pain. Voluntary motion was returning. The doctor reported that it was improving rapidly. When the was not greatly restricted. elbow was raised to the level of the shoulder, pain was felt along the track of the musculo-spiral nerve. and not under the coracoid process.

Fracture of the anatomical neck of the scapula is very rare. Gray, in his "Anatomy," does not mention the possibility. Stephen Smith in his "Operative Surgery," Hamilton in his "Surgery," Ranney in his "Surgical Diagnosis," do not mention it. F. Hamilton, in his work on "Fractures and Dislocations," says that it is very rare. Its existence "uncomplicated scapula. by comminuted fracture of the glenoid cavity is denied by Sir Astley Cooper, South, Erichsen, and others." No specimen is in any of the museums of London, and Hamilton has not been able to find one scapula, because: in any of the museums in America. Gross, in his work on "Surgery," says: "It is not improbable that together, with the scapula, and not with the humerus. the edges of the glenoid cavity may occasionally be violent propulsion of the head of the humerus. remarkable, however, that the existence of such a lesion has never been demonstrated by dissection." The "International Encyclopædia of Surgery" men-\tendency towards a return of the deformity. tions the case reported by Assaky to the Société glenoid cavity was found, but that was accompanied the scapula, for that was entire so far as I could dis with other fractures.

Such being the opinions of our distinguished surgeons, men recognized as authorities on the subject, surgical necks of the humerus, because: it is incumbent upon me to give my reasons for diagnosticating the case as I did. When the accident occurred, I did not think of the case being unique, or I should have called on other surgeons to verify my diagnosis. I give, therefore, my argument.1

The case was not one of simple subluxation, because:

- humerus, instead of being more prominent, was less prominent. A ruler laid along the external border of the arm, while the elbow was by the side of the chest, would touch the acromion process.
 - Reduction by manipulation did not occur. 3. Crepitus was discovered after reduction.
- 4. The head of the humerus could be felt in the axilla.
 - 5. There was no "thud" on reduction.

It was not a simple subglenoid luxation of the head of the humerus, because:

- Crepitus was present.
- 2. The elbow did not stand out prominently from the thorax, but the axis of the arm was nearly parallel to the chest wall.
- 3. Of the case with which it was reduced by traction.
 - 4. Of the absence of the "thud" on reduction.
- It was not a subclavicular nor a subcoracoid luxation, because:
- ⁴ This paper was read to the patient, in order to make sure that it contains no errors of fact

- 1. Crepitus was present.
- 2. The elbow could touch the chest.
- 3. The elbow was not drawn backward.
- 4. It was reduced easily.
- 5. The arm was slightly lengthened.
- 6. Communicated motion forwards and outwards
- 7. The head of the humerus was felt in the axilla,
- 8. The coracoid process was prominent.
- 9. No "thud" was heard or felt on reduction.
- It was not a subspinous dislocation, because:
- 1. There was crepitus.
- The depth of the shoulder was not increased.
- The tumor was felt in the axilla and not on the
 - 4. The elbow could touch the chest.
 - 5. No "thud" was heard on reduction.

It was not a fracture of the surgical neck of the

- 1. The acromion and coracoid processes moved
- 2. There was a marked depression and space, bebroken off, either by direct force, or by sudden and tween the acromion and coracoid processes above, It is and the humerus below.
 - I could discover no crepitus before reduction.
 - 4. When reduced there was no great or marked
- 5. Pressure on the scapula posteriorly did not pro-Anatomique, in which a stellated fracture of the duce pain. Nor was the break through the spine of cover by palpation.

It was not a fracture of either the anatomical nor

- 1. The limb was lengthened rather than shortened.
- 2. Movements of the humerus at no time produced crepitus.
- 3. The acromion was very prominent, and the depression below it deep.
 - Reduction was permanent.

I do not think there was a comminuted fracture of 1. Before reduction the upper extremity of the the glenoid cavity, because, in that case, there would be a greater tendency towards the return of the deformity after reduction. With a comminuted fracture of the head of the scapula there would be too little resistance to the sinking in of the head of the humerus. Moreover, pressure from the side upon the shoulder would tend to separate the fragments, and would therefore produce greater pain than was present in this case. The greatest pain upon pressure in this case was caused by pressure backwards just below the coracoid process. Further, in a fracture into the joint, we should expect more indications of synovitis than were present in this case.

The fracture may have entered the glenoid cavity. The slight change in the shape of the shoulder after reduction may be due to such a fracture, but not necessarily so. If the fracture did enter the glenoid cavity I think it must have been a simple fracture, and by far the greatest portion of the head must have been broken off. A study of the shape of the scapula strengthened by the ligaments will indicate that probably if much of the head is broken off, the frac-

ture would be one of the anatomical neck.

anatomical neck of the scapula?

- 1. There would be downward dislocation, with possibly dislocation either forward or back. dislocation would be caused by the blow received, tion to see another case, the record of which I will and when once displaced the broken bone would catch in the muscles. The coracoid and acromion processes would stand out distinct. There would be quested by my friend, Dr. W. H. Schaberg, to go a cavity below the acromion.
- 2. In proportion to the amount of dislocation it of the shoulder joint. would be difficult to obtain crepitus.
- the side on the shoulder.
- 4. The arm might be slightly lengthened, though not reduced for a week. not as much so as in the simple subglenoid luxation.
- broken head of the scapula, and the latter would be to witness a sham battle. The long ride and excitecaught in the muscular tissues surrounding, movements of the arm would not produce crepitus, and reaching home she was sitting alone in the bed room, would only produce pain, when it was raised to such getting the baby to sleep in her arms. Hearing a a position as would stretch the injured muscles.

RECTAL SURGERY MADE SAFE FOR FOOLS.

BY EDMUND ANDREWS, M.D., LL.D.,

PROFESSOR OF CLINICAL SURGERY IN THE CHICAGO MEDICAL COLLEGE.

A few years ago I learned and published the secret method of treating piles employed by certain fistulæ. itinerants. The secret was sold from one quack to another at a high price, and consists generally in the ently to be described. hypodermic injection of various mixtures of carbolic acid. The hopes of many physicians that the method hold the pocket when it is so shallow as to slip from might prove a useful one, were greatly dampened by the discovery of about eighteen deaths out of some 3000 reported cases, and of very alarming symptoms interior walls of a fistula to the depth of about a sixin other instances; in short, it was the same fatal experience as that which previously put a stop to the injection of venous enlargements in other parts of usages of educated men, it is called a "fistulatome." the body.

Of late the Lake States are being treated to a new and pouches. development; the little itinerant hypodermic syringe has budded and blossomed like Aaron's rod, and evolved little boxes of instruments and little books full of secret instructions, in short, little "systems" of rectal surgery, whereby, as one of the authors says, "operations which would otherwise be difficult can be accomplished with but little skill." The first style of boxes sells at a price varying from a hundred to a hundred and fifty dollars, according to the size of the purchaser's purse and credulity. They generally contain a hypodermic syringe and a rectal speculum, with a probe and a few other simple instruments, having some peculiarities of construction but no special excellence. An equally good set of instruments the flexible needle to the depth of fistula, then inject for the purpose would cost about fourteen dollars at | retail, in the ordinary instrument stores.

It is curious to notice the obvious effort to combline a set of instruments in such a way that an ignorant purchaser may accomplish something with hæmorrhoids is the following:

Armed with his little box and book the wayfaring doctor, though a fool, may read and practice, and perchance make money, if the crop of piles is good, sus, patient should take each night at bed-time a onealthough the science of the colleges never glanced eighth grain pill of the solid extract leptandrin, and upon his calvarium.

is, however, the same careful attention to the fact there are fissures of the anus, the sphinctors should that the purchaser is expected to be such a fool that be forcibly dilated for ten seconds, while patient is he cannot be trusted with edge tools, though some of under the influence of an anæsthetic. the later boxes contain the little blunt-pointed bistoury of Suns' uterine set, with an edge about half an ly for treating the rectum, operations that would otherinch long, for a purpose presently to be mentioned, wise be difficult can be accomplished with but little One set which I examined contained the following skill. Our speculum is the only one that is self-reinstruments;

1. A small rectal speculum.

- 2. A hypodermic syringe.
- 3. A tenaculum.
- 4. A small Sims' uterine knife, blunt pointed, and having an edge five-eighths of an inch long.
- 5. A Sims' flexible uterine probe, for examining
- 6. A blunt hook to pull down the "pockets" pres-
- 7. A similar blunt hook with two minute barbs to the smooth hook.
- 8. A scarifying probe, made so as to scratch the teenth of an inch. By a blundering combination of Greek and Latin in the same word, forbidden by the
 - 9. A flat scoop for clearing out the rectal pockets
 - 10. A ligature carrier, to facilitate ligating piles.
 - 11. A three ounce syringe.
 - 12. A hard rubber tube for oiling the anus.

There are no scissors, probably because they could be dangerously used by ignorant purchasers.

The following were some of the printed directions in the box:

"Radical Cure of Fistula in Ano. - First trace fistula with flexible probe. Wash out the track with a 5 per cent. solution of 'hydrogen peroxide.' Then inject a 95 per cent. sol. of carbolic acid, plus equal quan, of a 10 per cent sol, of muriate of cocaine. Draw about 10 to 15 minims in the syringe. Push slowly as you withdraw the needle. Within two hours inject oleum eucalyptus and glycerine, equal parts, and the operation is finished. Keep patient quiet for forty-eight hours."

"Немогрионь .—Hæmorihoidal tumors should them but shall not be able to do much harm. Generally be injected with an eight grain sol, of muriate of cothere are no cutting instruments whatever, and the caine, plus an equal volume of 'phenol sodique;' only sharp weapons are the hypodermic syringe and use of the injection from twenty minims to a drachm, the tenaculum. The chief formula for injection for according to size of tumor. It is seldom necessary to inject more than once or twice. This injection deposited in two and three drops, making the punctures one inch apart over the rectum, will seldom fail to cure prolapsus of the rectum. Should be repeated two or three times.

"During the treatment of hæmorrhoids or prolapthe parts should be kept anointed with 'ceratum Such an easy way to make money soon bred imitaralinum,' once a day for a week after the operation. tations. New boxes and new little books are in the After operation on the rectum of a female, the uterus Some contain several more instruments should be dilated, and after like operation on the than those above mentioned, and yet are sold at half-male rectum, metallic sounds should be passed as the price, being offered at about fifty dollars. There large as the urethra will admit; and in all cases where

action of the drug favored a separation of the partly healed iris, which I supposed had been lacerated at the lower border, covered by the blood clot. The then began to heal under the ligature as the stranguchild had been kept quiet in bed. Both eyes were : bandaged for a time; the right one constantly. Coffee and other stimulants were forbidden. In fact, closed and nicely healed. everything had been done to favor a rapid union of the parts. I decided to try the effects of ergot, and ordered the fluid extract to be given in 12-drop doses every three hours, in order to reduce the action of the heart and permit a sufficiently firm organization of the blood clots in the lacerated blood vessels. The introduction of this remedy was soon followed by good effects. The blood disappeared entirely, the pupil remained for a long time clongated, but later on resumed its normal shape.

FRACTURE OF CRANIUM; HERNIA CEREBRI; RECOVERY.

BY WILLIAM HENRY, M.D., OF HARMON, ILL.

In June, 1886, my little daughter, aged 8 years, kicked on the side of the head, the skull being fractured over the posterior superior portion of the right

I was absent from home at the time, and my friend saw the child, about three hours later, the pupil was Dr. Burns was called in; his opinion was that she telegraphed for, and on arriving at home in a few hours I found the child in a comatose condition, On the morning of May 20 but a small clot of blood her pulse regular and about 110. I sent for Dr. Burns, and we soon went to work to remove the At the next visit, May 21, I learned from the compressed bone, but after the removal of seven night, occasioned by spells of sudden intense pain, tirely relieved. She remained in a semi-comatose

We found the membranes ruptured in the anterior bed and ran to the window, which it opened. Hear-portion of the fracture, and portions of cerebrum ing the mother return it hastily essayed to regain its oozing therefrom; in all about half an ounce was bed, but stumbled and fell heavily to the floor. The lost. The edges of the wound were united with fall was followed by severe pain in the injured eye. stitches, the antiseptic used being a dilute solution of A second attack took place at midnight, and a third carbolic acid. In a short time the wound began to suppurate, and then became very much swollen. In I found the eye in a glaucomatous state. Tension the meantime I had returned to my place of business, + 1, very marked ciliary injection, anterior chamber leaving the patient in charge of Dr. Burns, who sent full of blood. The eye was rebandaged, and cold for me again when this last complication arose. I thought it would be best to open the wound in the solution of eserine was prescribed, two drops to be lowest portion and let out the pus. On his doing so

a considerable amount of pus escaped.

I again returned to my place of business, and in a the wound to gape open, and there soon appeared a At midnight the child was again awakened by the hernia cerebri, about as large as a hen's egg. Seeing this condition Dr. Burns called in Dr. Helm, of Rockford, and Drs. Donaldson and Herb; but they hesidition; extensive hemorrhage and increased tension. Itated to advise active interference during my absence. On my return, in a few days, I found the hernia ceretient. Whilst in the midst of a sound sleep it would Burns and Donaldson 1 determined to ligate the tumor at its base. I accordingly tied it with silk I besitated to reinstil the eserine, thinking that the ligature, drawing the ligature until the pulsation was almost diminished; and in a few days I again tied it, drawing the ligature until all pulsation ceased. It lated portion began to die and dry up; and in about fifteen days the tumor fell off, leaving the wound

—which, by the way, Dr. Philipovich proposes to Dec. 11, 1886. style "loco tetanus," instead of "muscular contraction." the term used by Dr. Ross—was 400 grammes, and the highest 2000 grammes. On analyzing the observations, it was evident that the lower degrees, of force were invariably sufficient in weakly and illformed subjects who had been either permanently or temporarily rejected by the recruiting authorities. Still lower figures were obtained on the examination of diseased persons, the lowest of all being afforded by phthisical patients. In all chest cases it was noticed that the "loco-tetanus" was more easily produced on the side where the disease was situated, or on that where it was the more extensive; thus in a case of dry plenrisy of the right side the figures obtained were—for the sound side, 550 grammes, and for the diseased side 150 grammes. The mean force: required in the 100 healthy subjects was 750 grammes. on the right side, and 850 grammes on the left; and as the limit of that which could usually be borne painlessly by healthy persons with the instrument used, (the head of which was a metal ball covered) with gutta percha), was about 700 grammes, it may be roughly assumed that if the contraction can be produced by a tap, the force of which is much below that which is sufficient to cause pain in a healthy subject, some pathological condition is probably present, or at least that the general state is below that of a vigorous man.—Lancet, Nov. 20, 1886.

DEATH AFTER WASHING OUT THE STOMACH.—At the meeting of the Cambridge Medical Society, on Nov. 5, Mr. Martin brought forward the case of a patient who was admitted into Addenbrooke's Hospital, under Dr. Bradbury, for stricture of the pylorus. He was 48 years old, and seven years previously had been an in-patient, with symptoms of pyloric ulcer. His stomach was now much dilated, and he suffered from flatulence, vomiting, pain, and increasing weakness. He vomited large quantities of frothy fluid, containing sarcinæ. Ten days after admission, it was decided to wash out the stomach. Soon after passing the tube into the stomach the patient became! very faint, so it was withdrawn. About two hours troduced into the cavity.-N. V. Medical Journal, afterwards, he complained of stiffness in the jaws, Dec. 11, 1886.

> TREATMENT OF WOUNDS OF THE BLADDER. - DR. JOHN HOMANS, Surgeon to the Massachusetts General Hospital, Boston, Mass., writes: "As bearing on the subject of the suprapubic operation for stone, which is being revived at this time, I may say that I have twice cut open the bladder during an ovariotomy. The first time was in my seventysecond case (one of dermoid tumor). The incision in the bladder was carefully sewed up with a continuous suture of silk, care being taken not to include the mucous membrane in the stitch. The bladder was closed tight, and a Sims catheter was kept in the urethra. The catheter was removed on the tenth day. The temperature was never above 99°, and there have never been any vesical symptoms at that time nor since. The second time was in my two hundred and tenth case—one of double papillomatous ovaries, the patient having been tapped eighteen times in five years for the removal of ascitic fluid. The wound of the bladder was more extensive than in the first case, and required twelve interrupted sutures of silk, in which the peritoneal and muscular coats alone were included. A catheter was kept in the bladder seven days. After that time the urine passed naturally. In neither of these cases was the bladder drained through the abdominal wound. If the catheter in the urethra will drain the bladder, it would seem unnecessary to have another exit in the roof of the bladder. It would be well, however, to leave a drainage tube in the integuments over the sewn-up bladder in case there should be any leakage." Medical Record, Jan. 15, 1887.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No. 65 RANDOLPH STREET,

CHICAGO, ILLINOIS,

SATURDAY, FEBRUARY 5. 1887.

RUPTURE OF THE URINARY BLADDER.

In the Lancet, of Dec. 11, 1886, SIR WILLIAM! MACCORMAC records the recovery of two cases of intrarecord, we believe, of recovery from this accident, turbed, have been done; and abdominal section, peritoneum, has been done.

He was admitted to the hospital fifteen and a half otomy. The irrigation was continued until the

hours after the accident, having walked a distance of about a mile, unaided. There was complete inability to pass urine; no symptoms of shock; abdomen distended and tender all over, but especially in the epigastric and hypogastric regions, resonant anteriorly with dulness in both flanks, varying with the position of the patient. Ninety five ounces of a slightly red colored fluid were drawn off, and the bladder was shown to be firmly contracted by its grasping the catheter, which did not move freely. The level of dulness in the flanks was now sensibly diminished, and taking the symptoms into account, signed. When neither is accessible, remittances may be made at the risk intra-peritorical rupture of the bladder was diagenosticated.

The operation was performed about twenty hours after the receipt of the injury. The bladder was found empty, and firmly contracted. "The rent was in the posterior aspect of the bladder, and extended from the superior fundus to the recto-vesical cul desac; it was median and vertical, and as nearly as may be four inches in length. The edges were rather irregular and thickened. So deeply did the peritoneal rupture of the bladder-the first positive rupture extend into the pelvis that great difficulty was afterwards experienced in the introduction of after operation. In these cases abdominal section the deeper sutures. To facilitate this the parietal was performed very soon after the patients were peritoneum was divided transversely on each side, admitted to St. Thomas's Hospital, and the rent and it was then found possible to draw the bladder in the bladder exposed and carefully closed by much further out. The intestines were pushed back numerous interrupted silk sutures; after which the with sponges held by one assistant, while a second peritoneal cavity was washed out with warm boracic pulled the bladder forward. Sixteen sutures of fine acid solution, and the external wound closed. As silk were then introduced after Lembert's method, the rarity and almost inevitable fatality of the opera- including the serous and muscular coats only, at intion are well known, it may be interesting to tervals of about a quarter of an inch, beginning at examine more closely the records of the two the lower part, and the first and last sutures were incases, and the remarks of the distinguished sur- troduced quite beyond the limits of the injury. The geon under whose care they recovered, as there is edges of the mucous membrane were thus thoroughly considerable diversity in the treatment recommended inverted and the serous surfaces brought into conin such cases. Catheterism, simply, has been prac- | tact. Wherever the closure did not seem absolutely tised, or washing out the peritoneal cavity from the complete and perfect, catgut sutures were introduced side of the perineum or urethra; median or lateral to the number of six or eight between the silk ones, cystotomy has been done to give direct drainage including the peritoneum only. The bladder was through the perineum; in some cases aspiration of now twice moderately distended with a weak soluthe abdominal cavity, abdominal section, sponging tion of boric acid injected through the catheter by a out the blood and urine, and leaving the rent undis- Higginson's syringe, and proved perfectly watertight. The peritoneal cavity was finally irrigated with two with suture of the rent, either completely or leaving gallons of a 1 per cent, solution of boric acid disthe anterior part unclosed, or making an opening for solved in water previously boiled and cooled down drainage in the part of the bladder uncovered by to a temperature of 98° F. The fluid was introduced by means of a tube attached to an irrigating can The first case recorded by Sir William MacCormac raised 8 ft. from the floor. It overflowed into a is that of a man, aged 33, who ran against a post, macintosh and thence to a tube placed at the foot of which struck him in the region of the umbilicus, the table, in the manner customary during ovari

A glass drainage- where the peritoneal covering and muscular coat tube was introduced from the centre of the wound were ruptured, and a quarter of an inch where the to the recto-vesical cul-de-sac. The edges of the internal coat was torn. A blunt director passed peritoneum and external wound were then closed by into the wound came into contact with the catheter deep silk sutures, and iodoform, iodoform gauze, and previously introduced. The rent in the bladder was salicylic wool applied, with bandages of carbolic closed by twelve fine silk sutures, rather less than a gauze. A soft black catheter was fastened in the quarter of an inch apart; the ends were cut short. urethra, the tip only projecting into the bladder. Each suture was passed by means of an ordinary The operation lasted two hours, and was conducted fine curved needle introduced about a quarter of an under the carbolic spray throughout, save for a few inch distant from the margin. The first and last minutes when the steam failed. The peritoneum pairs of sutures were passed through the bladder and intestines looked quite healthy, presenting a wall completely beyond the limits of the rent, so as polished appearance, apparently not injected. No to prevent the possibility of leakage from its exblood-clots were observed." There was no sickness tremities. On drawing the sutures tight, the closure after the operation, and all pain and tenderness dis- of the rent seemed so complete and secure that no appeared almost completely after it. next five days the temperature did not reach 100° F. From 30 to 40 ounces of urine were passed daily, being drawn every four hours, but containing no blood. On the third day, the catheter was removed, after which he passed urine naturally. The drain was removed on the fourth day, a small amount of serous discharge being sucked out at each dressing. The sutures were removed on the eighth day, and within a fortnight the abdominal wound had cicatrised. In three weeks he was able to get up.

The second case was more obscure at first than the one just mentioned. He came to the hospital immediately after a fall, but no symptoms directing attention to the bladder were observed by a most careful house-surgeon. A catheter was not passed, as there was no desire to urinate, and urine had been tion. The intestinal coats were free from injection; passed an hour before. There were no symptoms referable to the bladder until about seven hours after the accident, when he desired to pass urine but was unable to do so. He was re-admitted to the hospital about twenty-four hours after the fall, the sympt passed on each side, uniting the transversely divided toms rapidly increasing in severity. Three ounces of dark-colored bloody urine and clots were drawn off; and the symptoms were such that intra peritoneal rupture of the bladder was diagnosticated, and an immediate operation determined upon.

hours after the accident. After reaching the peri-effective and complete manner in which the rent in toneal cavity, and introducing the finger, the rent in the bladder was closed. A small, short drain was, the bladder was at once detected. "The bladder however, inserted in the lower part of the external peritoneum of half an inch being made on each side. fit of vomiting came on. There was severe abdomposterior part, and slightly to the left of the middle kept good, and the respiration was quiet and easy, line; it was much more extensive in the outer than except for a minute or two while the abdominal

escaping fluid became absolutely clear. There was in the inner wall, measuring two inches in length Within the additional ones through the peritoneal coat appeared necessary. The bladder was then fully distended by injecting nine ounces of a warm boracic acid solution through the catheter, and found to be perfectly watertight. The abdominal cavity was thoroughly washed ont with about two gallons of a 1 per cent. solution of boracic acid warmed to a temperature of 98°. The irrigator consisted of a large glass vessel raised four feet above the patient's abdomen, with a long India rubber tube and glass nozzle attached. At first the fluid flowed out slightly tinged with blood; subsequently it became quite clear. There were no clots. Before the external wound was closed as much of the residual fluid as possible was expressed. No signs of inflammation could be detected in the peritoneum where it was exposed during the operathere was no adhesion or lymph visible. No vessels of importance were divided in the external wound, and all bleeding points were secured as they appeared, catgut ligatures being used. A suture was edges of the peritoneum, and the abdominal wound and peritoneum were then united by eight stout silk sutures passed through the whole thickness of the abdominal wall. No drainage-tube was inserted in the peritoneal cavity, nor was a permanent catheter The operation was performed about twenty-seven passed into the bladder, confidence being felt in the was now drawn forwards, a transverse incision of the wound. Just before the dressings were applied, a An irregular obliquely placed rent in the bladder inal strain and a certain quantity of boracic fluid was was then clearly exposed, situated at the upper and forced up between the sutures. The patient's pulse

dered over the abdomen and groins. Iodoform serum penetrate everywhere. Wegner's experiments gauze and salicylic wool were applied to the wound prove that extravasated urine does not merely graviand kept in position by carbolic gauze and flannel tate, but that peristaltic movements of the bowel bandages. There is but little room for a discussion of the diagnosticate the injury. But even with an uncertain As with all operations on the abdominal cavity, the diagnosis it is both safe and justifiable to make an exploratory laparotomy. "If this be done early enough, it will prove successful in uncomplicated cases, while the operation in itself scarcely aggravates hesitating, halting practice in expectation of improvement, which usually never takes place."

CHOLERA IN SOUTH AMERICA.

It appears from despatches furnished by the United States Minister at Buenos Ayres, and published in Znamensky, Maksimow and Vincent have the weekly abstract of sanitary reports issued from

dominal cavity. "If the deeper structures be first the Cholera Hospital at Buenos Ayres was 200, of divided near the pubes, the anterior surface of the whom 93 died, 34 recovered and 73 remained under bladder can be exposed and examined before open-treatment, on December 3. Of the 200 patients, 130 ing the peritoneal cavity. If a rent be found there were from the male and female lunatic asylums, 12 from it may be unnecessary to proceed further; otherwise a prison, leaving but 58 cases as having occurred in the the serous cavity can be laid open and the upper and general city population during the month. During the posterior surface of the bladder laid bare. No other same month, in the smaller city of Rosario, having a manner of treatment seems likely to prove of real population of about 50,000, more than 200 cases

Buenos Ayres, December 10, says: "While a few a single death, followed me in the winter and spring cases of cholera are still reported in each day's bul. of 1882. The first case occurred after I was in atletin, the disease appears to have pretty much run its course at this port." In regard to other places obstetric patients escaped, when I was called to see the same authority says: "On the 4th of December a woman who was confined while convalescent from there were 13 deaths at Rosario and 14 new cases, erysipelas. The fever developed in her, and then and at Cordoba 2 deaths and 5 new cases." It is stated that a few cases have occurred at several small places outside of the cities named, but on the whole the disease is declining. At Buenos Ayres the health tedious convalescence, but has since had a child authorities appear to have adopted very efficient and energetic sanitary measures for preventing the spread of the disease, and thus far with encouraging success, and the alarm at first created has greatly subsided, but still the greatest vigilance is exercised to prevent the further spread of the disease in any direction.

LARGE CEREBRAL TUMOR.—DR. WM. S. ROBERTson, late Professor of Practice of Medicine in the Medical Department of the Iowa University, died at his home in Muscatine, Iowa, on the 20th of January, 1887, aged 56 years. He had suffered several months due to my old teacher, Prof. Penrose, who is a safe from paralysis and symptoms of cerebral disease, guide to follow. I owe much to his careful instrucending in complete coma forty-eight hours before death. We are informed that a post mortem exam-child is born, put on the forceps to "hasten delivery ination "revealed a tumor in the right cerebrum, and shorten the woman's suffering." I am very posextending from above downward and slightly back- titive that this frequent use of the forceps is abuse. ward about three inches, and from before backward two inches," as the evident cause of the symptoms and the fatal result.

SOCIETY PROCEEDINGS.

OBSTETRICAL SOCIETY OF PHILADELPHIA.

Stated Meeting, Thursday, January 6, 1887. W. H. H. GITHENS, M.D., SECRETARY. The Secretary read

A REPORT OF 616 CASES OF LABOR IN PRIVATE PRAC-TICE BY DR. II. H. WHITCOMB.

of Norristown. Up to March 31, 1886, I had attended 616 cases of obstetries. I have had no death of a mother and only two still born children; one of of these was destroyed by craniotomy. The forceps easier. Differences of the same kind in greater dehave been used in two cases only. I have had no gree exist between our native and the foreign popucase of twins. I have had one case of elbow pre-lation. I was much struck with this fact this sumsentation, one shoulder, one a hand and face, and mer when I went to the Anatomical Institute in Leipthree breech presentations; all the others were by sic, to Herr Dornfelder, to buy a normal female pelthe vertex. Placenta prævia was present in two vis. I was going to Berlin to return in a month, and cases at full term and in two miscarriages, one at instructed him to find a pelvis as near a normal speciseven and one at five months. A series of thirty-men in the museum as he could, in the large amount

tendance on a case of scarlet fever, and was followed by three other cases; the next two or three every case I attended that winter and spring suffered from it. Consultation confirmed the diagnosis in all cases. One instance was after a miscarriage at seven months following pneumonia. The patient had a weighing 13½ pounds. I tried to stop attendance on this class of patients, but could not get rid of them. The epidemic ceased as suddenly as it commenced, and I have not had a case since. smallest child delivered at full term weighed three pounds and lived only three days. Three deaths of infants have occurred from trismus, and four deaths, in children a few days old, for which I was unable to assign a cause. They simply mouned until they died, while they appeared to be in good condition. I had one case of hour-glass contraction and four of severe post-partum hæmorrhage at term.

My success I ascribe to patient waiting and conservatism. I do as little meddling as possible, and do not use antiseptic injections. The credit is partly tion. I see so many doctors who, in almost every case of obstetrics they get, if they arrive before the I have had a number, possibly twelve, of ruptured perineums; they were immediately stitched with a perfect result in all cases. I have never had a vesico vaginal fistula, although one of our teachers would impress his classes with the idea that these cases occur in the hands of the country practitioner. I might say the only cases I have ever seen were those in the care of city doctors.

Dr. H. A. Kelly remarked that Dr. Whitcomb's report was full of interest, and in criticising the observer must be careful not to impose the rules and statistics of an average. Philadelphia practice upon THE PRESIDENT, B. F. BAER, M.D., IN THE CHAIR. the Norristown people. While it is true that ailing, delicate women live and require obstetrical services in Norristown, as elsewhere, yet it is a fact that in Philadelphia the up-town mill population, from all over the civilized world, and the down-town populalation of pampered society women and alley offscourings, present very different problems to the accoucheur.

With notable exceptions labor in the country is two cases of puerperal fever, but fortunately without of material passing weekly through the Institute. On my return he gave me a specimen I now have in my ture of the complications, but he had gone too far office, which was the nearest to the normal he was to recede, for his hand had been inside of the right able to find; and he assured me that a normal pelvis-cyst-to-break-up-its-septa, and-blood-was flowing was rare. This dried pelvis with artificial ligaments profusely from it. The lady died twenty-six hours measures: Sp. 1, 25¹/₂ etm.; Cr. 1, 29¹/₂ etm.; Cr., later from shock and hemorrhage. 9 etm.; Dr., 13 etm. The argument as to different. Dr. Keith's have improved, not bea strong carbolized glycerine, has rendered excellent cause he has given up the spray, but because he has grown to his work. Dr. Goodell will give up the spray because it is an intolerable nuisance. As to the question of malignancy of ovarian tumors, it has from pressure of time on the part of the patient, and been said that "all ovarian tumors are malignant and should be so treated." This is too sweeping; but the tumor should in all cases be removed as soon as

possible, as soon as it is discovered.

Dr. R. P. Harris desired Dr. Parish to report the present condition of the patient from whom he had removed the ovarian tumor exhibited by him before the Society, at its meeting on March 4, 1886, the day after the operation. Dr. Parish requested Dr. Harris, who had seen her much more recently than he had, to report her condition. Dr. Harris stated that notwithstanding the fact that the tumor was largely solid; that it had grown rapidly; that the solid portion had an appearance of malignancy; and During the same period the total number of intra- that there was a small morbid growth projecting upward from the fundus uteri, the lady was to all appearance a well woman. He saw her on December 26, when she claimed to have perfectly recovered her

Menstruastraight from the caccum to the lower opening in the tion ceased three days before the operation. The specimen was interesting, though not exceptional, in showing the persistence of functional activity in such an extensively diseased organ. The left ovary was

> A PLACENTA, SHOWING VELAMENTOUS INSERTION OF THE UMBILICAL CORD, AND REMAINS OF AN EX-TENSIVE HEMORRHAGE INTO THE PAREN-CHYMA OF THE ORGAN.

> The term insertio velamentosa means a separation of the three vessels of the cord before they reach the placenta. The vessels pursue a straggling course between chorion and amnion, for a variable distance, and each one reaches the placental margin by itself.

> According to B. Schultze (Jenaische Z. f. med. u. Naturw., 1867, Heft. 2 and 3), the origin of velamentous insertion of the umbilical cord is as follows:

The autopsy was performed in the midnight before the burial, and in a small town, in a cold room and without conveniences.

The allantois carries the feetal vessels to the periphery of the egg, entirely irrespective of the future placen- in which the bowels are sometimes relaxed, occasional tal site. Indeed, it is comparatively seldom that the delirium, followed by a low, quiet state. Evidently future placental site is immediately reached. The he did not recognize typhoid as occurring in children. vessels penetrate all the chorionic villi indiscriminately. These vessels are subsequently obliterated in able that typhoid will be found to be a much more the chorionic villi not destined to form the placenta, frequent disease among children than has heretofore and vascular connection only remains with that por- been supposed." tion of the chorionic villi corresponding to the decidua serotina. With the further growth of the egg, under normal conditions—it makes no difference what point in children. Many cases of infantile and gastric in the egg periphery the allantois originally touched fever belong to this class." —as the amniotic sheath forms around the rudimentary cord, the feetus performs a movement of rotation, been observed during the first year of life, but is rare so that the vessels pursue a straight course to the under the age of 2 years. It is comparatively infreprevented by anomalous adhesions. The hindrance is adhesions of the umbilical vesicle, the ductus, or with that of the amnion, a complete sheath cannot are but different degrees of one and the same disbe formed, and the amnions forsake the vessels be- ease, typhoid. fore they reach the placental edge. Velamentous insertion of the cord can occur at the pole of the egg opposite to the placenta, or at any intermediate point. The anomaly is observed most frequently in cases of multiple pregnancy.

Velamentous insertion of the umbilical cord seldom leads directly to interference with the development of the fœtus. In labor, however, the vessels may be or, with the rupture of the bag of waters, a vessel may be torn and the child's life endangered by loss his chapter of eleven pages. of blood. afterward. As to pregnancy, already there is some experience to show that it does not interfere. The round ligaments are not elongated in pregnancy as to a certain extent away from them. In many cases of anteflexion or anteversion the ligaments are shorter than after an Alexander operation, yet give rise to no serious trouble in pregnancy.

Dr. Adolphus: How could Alexander's operation be of benefit if it draws the fundus down and the cervix up, since the enterocele is between the bladder and the cervix?

Dr. Byford: It draws the body of the uterus down under the intestines, displacing them upward. in order to secure a proper relation of parts.

(To be concluded.)

to them. By turning back the base of the broad Arnold, showed that seventy-eight new members had ligament it would tend to draw back into position been added during the year. The introduction of the urcter (which is in close relation with its posterior moderate monthly entertainments after the scientific edge), and at the same time the connective tissue work of the evening he thought had been of material through which the ureter runs and which is displaced advantage, especially in promoting harmony and forward with it. I know of no other method in goodfellowship, and in making the members better which the parts could be brought back so nearly to acquainted with each other; and he expressed the their former relations. A pessary could now be opinion that, should these gatherings be a means of worn until the parts had contracted and regained bringing the younger and older men into more friendly tonicity. If then the anterior vaginal wall remained and intimate contact, and induce the latter, as occasion offered, to extend a helping hand to such of the of the cervix and by a stitch passed around it drawn former as might be benefited by it, the results of this

Dr. H. M. Briggs read the history of an epidemic DR. ETHERIDGE: If Alexander's operation was of dysentery at the Almshouse on Blackwell's Island, satisfactorily performed, what would be the effect in which he stated that in the years 1884-5 there upon the bladder and upon subsequent pregnancy? was some dysentery in this institution, though not of DR. BYFORD: After the operation the fundus is an epidemic character; but an examination made by not, or should not be, held down upon the bladder an inspector of the Health Department showed the as firmly as in some cases of anteflexion in which sanitary condition of the buildings to be good. Some there are no bladder symptoms of any account. I closets which were undoubtedly the cause of the have performed three operations. In one case the trouble were not, however, inspected, as they were bladder symptoms were benefited, in the others separated from the main buildings and did not attract there were none complained of, either before or attention. The epidemic in q estion commenced early in June, 1886, and the cases increased in number and severity until the 15th of July, when Dr. Briggs came on duty. At this time from twelve to much as would be supposed, since the uterus grows lifteen new cases of severe dysentery appeared each week in the female almshouse, and the weekly number of deaths from the disease amounted to five or six.

Believing, as he does, that dysentery, in the vast majority of cases, is an intectious disease, due to some definite, determinable cause, he immediately made a careful inspection of all the buildings in the institution, as well as of the food and water supplied to the inmates; examining closely into all the conditions which might possibly bear upon the development of the disease. Aside from the element of The cervix needs to be held upward and backward overcrowding, nothing could be found to which importance could be attached, as regards the causation of the epidemic, except the state of the water-closet above referred to, which was in general use by the This was separated from the main building by a roadway, and had a large cemented brick vault, with a sewer about one foot in diameter leading from it to the river below, which was found to be in an exceedingly bad condition. The vault was flushed by the water from the bath-house, which was in the same enclosure, and by the rain-water from the roof of the main building. At the time of the examination the vault contained two or three feet of semi-solid faccal matter. During the early part of the summer the weather had been very dry; so that the supply of water from either source was very small. As far At the January meeting of the New York County as could be learned, the closet had not been cleaned Medical Association, the following officers were since the autumn of the preceding year, and it was elected for the ensuing year: President, Dr. John ascertained that the outlet into the sewer mentioned Shrady; Vice President, Dr. J. R. MacGregor; Re- was eighteen inches above the lowest portion of the bottom of the vault, which was round. Moreover, the sewer was found to be partly stopped up; and Arnold; Treasurer, Dr. Charles Ellery Denison; when it was remembered, said Dr. Briggs, that the Member of the Executive Committee, Dr. Edwin closet was in constant use by nearly 800 persons, some idea might be formed of the conditions prevailbichloride of mercury was ordered to be placed in disease after having become residents of them. the vessels of all who were affected with diarrheea in the interval between July 18 and September 25, the of the New York State Board of Health (1882). closet was cleaned a number of times. Certainly the experience of Troy proves that it cannot be in represented as originating from the femoral, so called, troduced in a city with safety even for those who do just above Poupart's ligament. The point of origin not use it. P. B. P.

ELECTROLYSIS IN UTERINE FIBROIUS.

Dear Sir := I note on page 79, of The Journal. of January 15, 1887, 2d column, lines 56-64, the foll-tive Surgery. lowing: "Dr. William T. Belfield said: Dr. Martin has conferred a favor upon us in bringing Apostoli's Gray's Anatomy to have this plate corrected in their method before us. During the last twenty-five years next edition. various attempts have been made to reduce fibroids of the uterus by the galvanic current; yet none of them have been recognized as successful, because, doubtless, as Dr. Martin very properly says, the current has been used in an ignorant, inaccurate and bungling way."

I remark as follows: "During the last twenty-five years" I performed the first operation on Mrs. Robert Pierce, of Melrose, Mass., August 21, 1871, so it is about sixteen years since electrolysis of uterine

fibroids has been performed.

"The current has been used in an ignorant, inaccurate and bungling way." In the February and succeeding numbers, 1887, of the American Journal of Obstetrics will appear the full account of the first fifty cases of electrolysis for aterine fibroids, to which the gentlemen named are respectfully referred. These cases are brought up to date as far as possible. The following points are of interest: Apostoli used currents of 1-25 to 1-5 ampère, with up to 200 applications in his cases, and reports no absolute cures. The report about to be printed shows a current larger than Apostoli's, the battery measuring 27 to 30 amperes, and from one to nineteen operations. The general résumé is, seven non-arrests four deaths, twenty-five arrests, three relieved, and *eleven cured*. Since these first fifty cases there have been quite a Respectfully yours, number of cures.

EPHRAIM CUTTER, M.D. 1730 Broadway, New York, January 18, 1887.

AN INCORRECT WOOD CUT IN GRAY'S ANATOMY.

Dear Sir:—I have before me the tenth edition of Gray's Anatomy opened at page 925, on which page is a plate representing a view from within the pelvis, report of a case of pseudo membranous bronchitis, This cut is given to illustrate the anatomy of hernia, by Dr. H. A. Johnson, and the discussion of the and especially the relation of certain blood-vessels to same, I called to mind a case in the Boston City the hernial openings. Let the reader now turn to Hospital. The case was acute and diagnosis not this cut in his Gray, no matter what edition, although perfectly clear, but the autopsy showed a fibrinous the page may not be the same as the one given. In false membrane lining the bronchi. looking at the cut it will be observed that the large seeing perfect casts of the bronchi that he expectorartery and vein are designated: "Femoral Artery," ated. If diphtheria could be excluded, it would leave "Femoral Vein." These names are printed on the acute pseudo membranous or fibrinous bronchitis as vessels. The names are incorrect at this point on the diagnosis. Thinking the report of the case might these vessels. The artery is the external iliac, the prove of interest to one in writing upon the subject,

pipes into cellars, and thus up through the house, on vein the external iliac vein. The names femoral premises where it was not used at all. It is a per- artery and femoral vein are not given to these vespectly inodorous gas, composed largely of the deadly sels until they pass beneath Poupart's ligament. carbonic oxide, and it is likely that its manufacture! This plate serves to confuse the student in his studies

> It will be noticed that the deep epigastric artery is of said artery is correctly given, but it is from the external iliac and not the femoral. Correct the names of the large blood vessels mentioned and confusion will disappear. I am surprised to find this same wood out reproduced in Stimson's Opera-

It would be well for the editors and publishers of A. C. Simonton, M.D.

AMERICAN MEDICAL ASSOCIATION.

Dear Sir:-Lately in The JOURNAL you made an appeal for papers to be prepared for the next meeting of the Association in Chicago, June next. In local societies the great difficulty lies in the selection of a subject. So often have papers been prepared based upon a single case that they have come to be looked upon as an advertisement of the writer. Would it not be well for the chairmen of Sections to select subjects in their various departments, and by correspondence learn who will write upon them? or publish a list of subjects in The Journal, with a request that those who would write upon them should inform the chairman, either personally or through THE JOURNAL. The members of the Association would, by this means, know what papers they could expect, and prepare themselves beforehand for their discussion. It seems to me in this way an interest would be excited that would attract attention, and both authors and disputants be benefited. It is very difficult, on the spur of the moment, to discuss any subject meritoriously and satisfactorily to either party. All special papers should be announced through The JOURNAL at least one month in advance of the annual meeting, giving title, etc., with a brief intimation of what the writers propose to set forth in their Yours truly, papers.

William Brodie, M.D.

Detroit, Mich., January 27, 1887.

PSEUDO-MEMBRANOUS BRONCHITIS.

Dear Sir:—While reading, in THE JOURNAL, the

in the Boston Medical and Surgical Journal, of March multiplying far more rapidly than are openings for 1, 1883. Yours respectfully,

HERBERT S. JOHNSON, M.D.

16 John St., Lowell, Mass., Jan'y 21, 1887.

INTERNATIONAL CONGRESS.

TRANS-ATLANTIC RATES.

For the information of our foreign brothers who propose to attend the meeting of the International Medical Congress, which takes place in Washington, D. C., on the 5th of September next, the following rates of travel across the Atlantic ocean have been submitted and recommended for their acceptance:

Red Star Line-\$100, Antwerp-New York and return.

Inman Line-\$100, Liverpool-New York and return.

Hamburg Line-\$90, Hamburg-New York and

Royal Netherland—\$80, Antwerp-New York and

The committee have proposed that each delegate shall have the privilege of bringing with him, at the same rate of expense, two lady members of his family, and believe that proposition will be accepted by those lines selected. Steps have also been taken to ascertain, at each of the four ports, Havre, Liverpool, Antwerp and Hamburg, the exact number of persons who will embark at these ports entitled to this reduction of rates. All further information on this subject will be promptly published in The Jour-NAL OF THE AMERICAN MEDICAL ASSOCIATION.

A. Y. P. GARNETT, M.D.,

MISCELLANEOUS.

WOMEN DOCTORS FOR INDIA. - The London Graphic says: Lady Dufferin appeals to the women three cents in stamps. One hundred copies, \$2.00 of England to subscribe what they can to the funds of the National Association for supplying female medical aid to their dusky sisters in the East. It is a most laudable undertaking, very large numbers of women in India being without medical attendance during sickness. They would sooner die than allow a man to see them, and they have, therefore, to trust for their recovery to the old wives' remedies which ever, that education is beginning to invade the sacred precincts of the purdah, the inmates are no longer content to trust their lives to ignorant crones, who are more skilled in distilling poisons and witchcraft than in useful medical lore. The demand, therefore, for women doctors from England is a genuine one, and not one of those philanthropic "fads" which are too often palmed off on the British public. There is another feature, moreover, which should commend the appeal even more to our favor. Rumor.

I would refer to the account of the case as published says that the number of lady doctors in England is practice. But in the East they have a splendid opportunity before them, in the multitudes of native ladies whose husbands can afford to pay substantial fees. They would be safe, too, from masculine competition, nor would they feel that they were intrud ng upon a province not belonging to them by right. Indeed, so promising is the enterprise that one can only wonder an exodus of lady doctors bound for the East did not take place long ago. There is one matter, however, in which they must be very careful, to respect native prejudices. It is said that some of them sedulously cultivate masculine manners and appearance, in order to gain the confidence of their patients. This will not do in India; the Asiatic husband is very suspicious, and would probably detect in the supposed female Hakim an enterprising Feringhee bent on making surreptitions love to his many wives behind the purdah.

> A GOOD RESOLUTION.—At the recent annual meeting of the Ohio State Board of Health, Dr. Jones introduced a resolution requiring that every railroad company doing business in Ohio shall carry on its trains an emergency case, which shall contain bandages, cotton, and other things desirable in accidents, and that employes shall be instructed in their use by the surgeon of the road.

> HYPNOTISM AND POLITICS. — While Chareot is electrifying Paris with the results of his hypnotic experiments at the Salpetrière Hospital, Virchow, in Berlin, for the nonce has withdrawn from "The Battle of Cells and Bacteria" and is fighting the battles of his party against the redoubtable Von Moltke.

Dr. Joseph Taber Johnson was elected President Chairman of Committee of Arrangements. of the Medical Society of the District of Columbia at its last annual meeting.

> THE CODE.—The cheap reprint edition of the Code of Ethics of the American Medical Association is now ready. Physicians, or others, wanting single copies should send to the Editor of The JOURNAL

> St. Louis Medical Society.—The Weekly Medical Review says: In the fifty years' history of this Society no administration was more successful than that of the president, Dr. E. H. Gregory. It also pays a high compliment to his successor for 1887, Dr. S. Pollak.

The Chicago Hospital for Women and Chilare among the traditions of zenana life. Now, how- DREN.—Mrs. George M. Pullman gave an amateur theatrical entertainment at the Pullman residence on Tuesday evening, which netted \$1000 for the hospital.

CANTTHE CÆSAREAN SECTION BE SAFELY SUB-STITUTED FOR CRANIOTOMY IN THE UNITED STATES AT THE PRESENT TIME?

Read before the Medical Society of the District of Columbia, January 12, 1887.

BY JOSEPH TABER JOHNSON, M.D.,

PRESIDENT OF THE MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

provements which have been made in the ancient and est in abdominal surgery, I am inclined to change my time honored operation of the Cæsarean section. To views, exactly reversing the position stated above, Dr. Harris, of Philadelphia, are we mostly indebted making the Casarean section the operation of elecfor this revival of interest. He has repeatedly pointed tion, when possible. This, of course, leaves craniout that this operation, which, in the past, has been otomy as the operation of necessity; and when necregarded as almost universally fatal to the mother. essary, therefore, I would feel compelled to resort to can now be performed with great safety, and with the it. I cannot agree with those writers who would enresult of saving more lives, when resorted to early, tirely abolish it, and who denounce craniotomy as than by any of its alternatives. This statement is made by Dr. Harris after collecting the histories of a "murderous operation," as "killing the infant," as the comparatively large number of cases in this country "deliberate and cold-blooded nurder of an unoffendand in Europe. These remarkable results have been ing child," etc. I think craniotomy, even upon the achieved by a few men, mostly in Germany, who live child, may become a perfectly justifiable operation have had a large experience in abdominal surgery, and who brought to their assistance the many improvements which a number of operators had been attention, and as the success of abdominal surgery gradually making, in different parts of the world, in strides on with such surprising and startling rapidity, the Cæsarean section for many years. These successful operations have aroused the enthusiasm of a to change our views, and to be convinced, by the onfew writers to such a degree that they have been led ward march of events, that new practice, based upon to declare, with great fervor, and an eloquent display late experience and improved statistics, may be betof statistics, that craniotomy upon the living feetus ter and safer than the old. would hereafter be unjustifiable, and that the improved Casarean section must not only be the operation of election in the future, but of necessity also. Thus Dr. Meadows, of London, within the past three months, in a paper read before the British Gynecological Society, upon "The Total Abolition of Craniotomy," was so carried away with the wonderful and surprising figures of Dr. Harris, that he exclaimed, in a sudden burst of enthusiasm: "Where, I ask, is mother a better chance for life than craniotomy ofcraniotomy now?" Dr. Meadows quite convinced fers, and at the same time, while not diminishing her himself, but, according to the record, none of his chances, afford us an opportunity of saving the child audience, that craniotomy should be forever abol- also. I do not think it is sound practice to be govished from the list of justifiable operations. It was erned by the mere statistical intent to save the greatgenerally agreed, in the discussion which followed, est number of lives, without any reference to the that the best thing ought to be done; that whenever value of those lives. The Cæsarean sectionists use the Cæsarean section offered the best chance it an argument which sounds well, and which, for statis-

should, of course, be urged upon the family, but that there would always remain a certain small proportion of cases, mostly in primiparae, where craniotomy would have to be performed.

When this subject was discussed in another society, in our city, two years ago, I took the ground strongly that past experience, as well as the teaching of nearly all the text-books in use by the colleges, declared that craniotomy, when indicated, should be considered the operation of election, and the Cæsarean section the operation of necessity.

In view of the growing success of "the improved Much interest has been excited of late in the im- Cæsarean section" abroad, and of my growing inter-"child murder," as an "abominable crime," as that under certain exceptional circumstances.

> Science advances, and as new facts come to our we are entitled, without being considered inconsistent,

> While I should be slow, as a teacher of obstetrics, to allow the writers in the ephemeral and frothy medical journals of the day to offset, with a few newlyacquired statistics, the crystallized teachings of the regularly authorized and recommended text-books, new as well as old, for the guidance of students and practitioners of medicine, I should hail with infinite satisfaction any practice which would give to the

about the unborn children, when the mortality of until the mother's life is also imperilled." craniotomy would be stated, upon this basis of calculation, to be 50 per cent. higher than the deaths of same work, Barnes says: "If the operation could be the mothers would properly place it. Thus, of 100; done at a chosen moment, and so improved as greatly craniotomies, if the mortality should be stated to be to increase the probality of saving the mother, then 60 per cent, the general reader might think that sixty, the already high probability of rescning the child of the mothers had perished as a result of the opera- might turn the scale in favor of the Cæsarean section tion; when, according to this mode of making sta- and against craniotomy. Unfortunately, art has not tistics, the statement would mean the death of fifty yet reached this point. The mortality to mothers feetuses and only ten mothers.

medical, ethical or theological. As long as the good to the rank of an elective operation." Lord continues to make human beings to differ so toms, environment, vital force, extent of deformity or obstruction; and he governed to some degree by the wishes of the patient who engages our services.

This is a free country and we, of course, have the inalienable right to refuse to remain responsible where our advice is rejected. But the patient has the same right to refuse to have an operation done which gives her so little chance of recovery as even the improved Casarean section does in this country.

If we are in attendance upon a case of midwifery which lasts longer than twenty-four hours, where the powers of the patient are showing positive signs of failure, where the forceps have been tried a number of times and failed, where the head is too far down to resort to version, and where, in order to save the now rapidly sinking mother, a corps of consulting physicians submit to the agonized husband and wife the sad alternative of craniotomy or some modification of the Caesarean section, and they refuse to perhimself by some cast iron rule, or allowed somebody else to bind his hand and his conscience for him, never, under any circumstances, to destroy what ricians rest the right to sacrifice the child for the sake little life is left in the long compressed and nearly of the mother is a very old one, and has met with lifeless unborn fœtus—is this woman (who has engaged this physician to see her safely through her ated by Cicero for example, and sustained, in genhabor) to be left in jeopardy while the fœtus is given the precious hours, to become unmistakably dead, in such peril that both cannot be saved, but one will which may decide adversely the fate of the mother be, by the sacrifice of the other, let that life which is also! Those who would refuse to do craniotomy of the least value to the State or to society perish. upon the live child, but would be willing to do it if It is unnecessary to show that the adult woman, with the child were surely dead, will sometimes, while her various domestic and social duties, has a life of obeying their cast iron rule, let the mother slip through their fingers also. I should hold with Barnes

tical purposes, would undoubtedly earry a point, and upon this point, who says, on page 845 of his Obperhaps an audience; inasmuch as by the performance stetric Medicine and Surgery: "On the continent of the Clesarean section more lives could possibly be especially, it is still urged by some to wait until the saved for the census to record among the inhabitants child is dead. If it be admitted-and the conditions of our country than as if craniotomy were sometimes of the case involve these postulates—1, that the child done. Of course, 50 per cent. of the "lives involved" cannot come through alive; 2, that the operation is are lost, as well as a very small per cent. of the moth-undertaken in order to save the mother, waiting till ers, but I thought, when I heard an argument some the child is dead is opposed alike to reason and to time ago upon this subject, that the speaker rather humanity. It seems a refinement of casuistry to disstrained a point, when he added the 50 per cent. of tinguish between directly destroying the child, and the already dead or sacrificed feetuses to the ascer-leaving it exposed to circumstances which must inevtained mortality to the mothers, of the craniotomy itably destroy it, and it is risking the very object of operation. I doubt if every one would stop to think our art, to wait for the lingering death of the child

In speaking of the Caesarean section, on page 855 from the Cæsarean section is still so great, whilst that We cannot, as conscientious physicians, be bound from embryotomy, in fitting cases, is so small, that we in our practice by cast iron rules, whether they are are unable at present to raise the Cæsarean section

In view, however, of the success of the improved widely from each other, just so long shall we be com | Casarean section, I should be inclined to hold with pelled to judge each case by its own peculiar symp-| those who would, if they could, raise the Cæsarean section to the rank of an elective operation; but we should hold ourselves free, in case this elective operation were not elected by those who had the right to vote, to perform craniotomy, upon the live child even, if we believed that by doing so we could save the mother. l should agree with Lusk, 1885 [Science and Art of Midwifery, p. 425] that "If in any case the decision is left to the physician, he should regard the welfare of the mother as of paramount importance. . . . The duty of the physician is, however, to his patient. He is not to constitute either judge or executioner."

As the work of Prof. Parvin has been published within the past month, it may be of interest to record his views as the latest authoritative statement from an American stand-point. Professor Parvin says, upon page 650 of his book: "Some, indeed, have had so strong a repugnance to directly sacrificing the life of the child, that they have done it indirectly, waiting until it died before resorting to the operation; thereby mit a cutting operation to be done—what is the in no sense evading the responsibility for its death, attending physician to do? Suppose he has bound and, at the same time, this delay has added to the perils of the mother.

> "The principle of morals upon which most obstetgeneral acceptance. That principle, clearly enuncieral, by moralists of all ages, is, that if two lives are

Operations performed in good season, when the condition of the woman was favorable, have saved 75 per cent. of the cases in this country, and 80 per cent. of the children.

It will be seen by this record that the number of operations is gradually upon the increase, and that the results are steadily becoming worse year by year. If we take the last five years—August 1, 1881, to August 1, 1886—we have nineteen operations, ending fatally in seventeen cases, saving but 10 10 19 per cent. Of the children, fourteen were also lost; of which two were destroyed by craniotomy, and one had its skull fractured by the forceps. In this list is not included an operation upon a moribund woman, performed in the interest of the feetus.

This is a frightful picture! In fact, it makes one sick at heart, in view of the fact that Europe, by the Sänger method, has saved 78 per cent., or 26 women out of 33; and 31 children.3 There has been very bad management somewhere, and I am inclined to believe that much lies in the fact that American obstetricians have not paid sufficient attention to pelvimetry, and are wanting in the skill that has been acquired in the maternities of the old world, by which they first determine the possibilities of delivery per ruas naturales, and finding the measure of obstruction, resort promptly to the knife without endangering the life of the woman by intermeddling and use-ROBERT P. HARRIS. less delay.

Great stress has been laid by those who would always do the Casarian section, and never consider craniotomy justifiable if the child was not known to be dead, upon the recent successes in the Caesarcan section by the "Sänger method" in Germany. But Germany, unfortunately for this recent authority in the October number of the American Journal of Obstetrics, page 1021, by Garproperly be called by his name as by Sänger's, and further, that there is really nothing in this "method"

ternity hospitals, of Dresden and Leipzig together, have had sixteen operations with fifteen maternal recoveries, and the survival of all the children." This. I am glad to admit, is a most successful and glorious record, and one which American operators should strive to equal. But it is not fair or correct to state this phenomenal success as the present standing of the improved Casarean operation. You might as well quote the phenomenal success of Mr. Tait, in doing 146 ovariotomies without a death, as the present happy standing of ovariotomy throughout the world, and expect others to obtain the same results.

Garrigues evidently had this same thought in his mind when he wrote, less than a month ago, page 1021—"It is not to be expected that this record will be kept up to its present standard. So far, the excellent results are due to the fact that so large a proportion of the cases have been operated on by one man, and a still larger proportion by a few men, all intimately connected, all perfectly familiar with antiseptic precautions, and skilful gynecologists. It is to be expected that when the operation becomes so popular that it is performed by many, and less well prepared operators, the results will again decline proportionately."

Garrigues says, "further, on the other hand, I am not prepared, with several authors, to teach that the improved Cæsarean section should be substituted for craniotomy, and to stamp, as an abominable crime, the destruction of the living fœtus, if by such a sacrifice, there is reasonable hope of a safe delivery for the mother. We must remember that similar antiseptic precautions to those upon which success in the new operation seems exclusively to turn, have benefited the operation of craniotomy.

Garrigues then refers to three recent craniotomies done by himself, two upon the living fœtus. All the mothers made an excellent recovery, and at no time presented any serious symptoms—one of them did not even have the slightest fever. In view of the recent successes in the Poro operation, I should feel disposed, in cases where there was a demand for the Cæsarean section, and the parties interested consented to have it done, to go still farther, and remove the uterus, or at least the ovaries and tubes, and thus make it forever impossible for the woman to be environed by the same dangers again.

It has been demonstrated that the success of repeated Cæsarcan sections on the same person is greater than first operations, but is nevertheless, a dangerous procedure. I am convinced that the failure of the Cæsarean section to succeed in our country is largely owargument, is not the United States. To quote from ing to the fact that the operation is performed after the patient has been worn out by prolonged and useless efforts to deliver her. If physicians and patients rigues, who claims that the Sänger method should as only believed this operation was the best one to perform and that it should be done early, and that it did not mean sure death, as so many seem to think, this after all, as the most successful operators get on obstacle would be removed and the door opened to better without using it-Garrigues says: "It is of a more successful future. - 2. Operate with full antiseptic precautions; for, of all abdominal operations, no other demands so it is certainly destroyed. But this does not repreabsolutely that asepsis should be secured; but the spray over the abdomen is unnecessary.
- cervix, either manually or with rubber tubing, but preferably manually.
- 5. Carefully protect the peritoneum from contact section. with fluids, and make a careful toilet of that membrane, if perchance it has been soiled.
- 6. Administer ergotine hypodermically at the beginning of the operation.

[Remarks of Dr. Barnes, in the discussion on the paper of Dr. Meadows, which he read before the British Gynæcological Society 13th October, 1886, in which he favored the total abolition of craniotomy:

Dr. Barnes said he disclaimed the part of apologist of craniotomy. He earnestly hoped the time would come when this revolting operation might be abolished. He had worked hard towards this end. Some of the most trying hours he had ever spent had of the mother's life.

The problem would be nearer solution could we wound. Notice that in thirty-three operations by perfection that the mortality attending it would be this method, in Europe, thirty-one children were reduced to the mortality attending craniotomy. And saved. What does this indicate? It demonstrates here he disputed the validity of the statistics cited labor; that forceps, version, and craniotomy had not of the Cæsarean section according to Sänger's method been resorted to. It demonstrates that the obstet- at 20 per cent. Of these, emetic gr. $\frac{1}{24}$ to each dose of calomel. 32 were treated by other physicians and by methods per cent; 5 were treated by me as above described, with 2 deaths, a mortality of 40 per cent. Of the cases which recovered, one occurred during convalescence from measles (case 5), when, according to Steiner, true croup is much more common than false, while the reverse holds true in the beginning of measles.

Both Steiner and Monti lay stress upon the rarity of recovery from croup occurring in the desquamative stage of measles, the latter never having seen one get well. In the second case (case 6) the extensive pharyngeal exudation, which had been seen by the mother, had disappeared when I was first called, but the submaxillary glands were much enlarged. The third case (case 8), may have been one of severe spasmodic croup, although the long duration of the prodromal stage (four days), the first occurrence of suffocative attacks at noon, the severity of the symptoms, and the slow recovery, speak rather for pseudo membranous obstruction. Of the fatal cases, the first (case 4), was fulminant, and time was lost by treating it at first for spasmodic croup; in the second (case 7), the treatment had a pretty fair trial, but failed to save the patient.

Following is a brief review of my cases:

October 16, 1881, with cinchonidiæ sulph. and tr. fer, chlor, internally, and had throat swabbed with acid, carbol, and liq. ferri subsulph, in glycerine. Exudation in pharynx on 20th. Now added to other treatment pilocarpin mur. gr. 1/48 q. 2 h.

tion of the medical profession to the local use of ing, that should there be a return of the disease he pyrogallic acid, though it had long been used in the would surely let me know. He was placed from arts, particularly in photography. Dr. A. Vesey the first upon Fowler's solution of arsenic and ad-(Dublin Journal Med. Science, 1878), observing its vised to continue its use for at least six months. remarkable astringent effects on the hands of those engaged in photography, was led to employ it in internal hemorrhage, and especially in the hemophysis of phthisis, in which he found it very efficient in grain doses frequently repeated (every hour or oftener.)

Jarisch first used it in the form of a ten per cent. ointment, with vaseline. Besnier, of Paris, makes use of a saturated solution of the acid in ether, applies it with a camel-hair pencil to the diseased portion, and at once covers this with a layer of tranmaticine. These applications are repeated until the

disease is thoroughly eradicated.

Schrummer, of Buda Pesth, after destroying the lupoid tubercles by means of the ten per cent, ointment already mentioned, prevents a return of tubercles in the cicatrix, which is of frequent occurrence,

by the application of mercurial plaster.

In some few cases in which pyrogallic acid has been used extensively and long-continued, poisoning has resulted; but when its use is restricted to the removal either of lupus or epithelioma, it is not at all likely to be complicated by any such unpleasant result. In cases of poisoning the kidneys are first affected, prostration and febrile disturbances appear, the urine becomes brownish or olive-green in consequence of hæmoglobinuria, the skin tinged with green, and a glairy mucus is vomited.

Dr. Charles W. Allen, of New York, has reported a number of cases of lupus treated by pyrogallic acid, and has expressed himself as most pleased with its effect. He made use of both the powder and ointment of varying strength, made with vaseline. He considers the acid of great value because it specially attacks the lupoid tubercles, induces destructive ulceration in and about them, leaving the healthy tissue

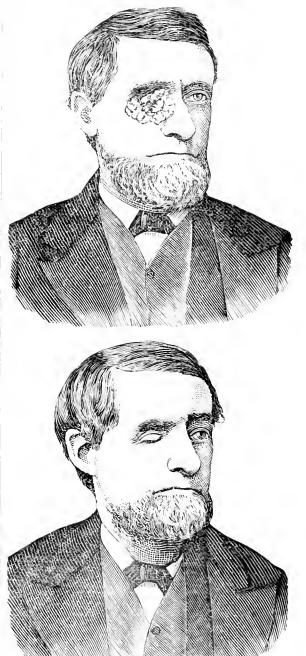

unchanged.

In any preparation of pyrogallic acid care must be exercised not to combine it with an alkali, which would neutralize it; nor with a metal, which it would

Six cases have been treated, but in Case 1 iodoform in powder was used instead of pyrogallic acid.

Case 1.—Jas. M., &t 45 years. Was first attacked twenty years since while in the U.S. Army. The disease made its appearance at the inner canthus of R. eye. He attributed it to an injury received while riding under a tree and being hit by an overhanging limb. The disease gradually extended to the under lid, involved a portion of the upper, encroached upon the cheek, and finally the deeper tissues of the eye itself. The patient was given ether and the dis-

Gallic acid, which creted from the blood that only a very small quanmay be more properly classed as a remote astringent, tity is present in the circulation at any one time; does not precipitate albumen or gelatin, and does not and the experiments also show that tannic and gallic tan; and its astringent taste is but barely perceptible acids are excreted chiefly by the bowels, to a small *Pyrogallic acid, while it precipitates albumen, differs extent by the kidneys, and by no other channel. markedly in other respects from tannin. In making his investigations Dr. Stockman selected, as representative members of the vegetable astringents, gallotannic, catechutannic, rhatany-tannic, gallic and pyrogallic acids, using the pure material, or as nearly pure as it could be obtained, first giving attention to the form and amount in which these bodies are absorbed, in which they circulate in the blood, and are excreted, and then to their action on the bloodvessels and circulation.

The experiments on absorption and excretion were made with gallotannic (ordinary tannic) and gallic acids. When tannic acid, says the writer, is taken into the stomach, it unites with the alkalies and the albumen present, and both these, and in the intestines, becomes converted, wholly or partially, according to the dose and time allowed, into gallic evaporated to dryness, and extracted with acetic acid—as was shown by Schroff in 1853. "Absorp- ether. The acetic ether was then drawn off at a tion into the blood may take place as tannate and gentle temperature, and the residue (which must be gallate of alkalies, or possibly as tannate of albumen quite free from water) washed several times with dissolved in the alkaline intestinal secretion." Cav- hot benzole. The washing with benzole was for the arra, Mitscherlich and Hennig, who investigated this purpose of removing any pyrogallic acid which might subject over thirty years ago, found only a trace of be present, tannic and gallic acids being quite inthese substances in the blood; and it is probable soluble in it. The gallic acid was then removed by that their failure may have been due to crude pro- washing with anhydrous pure ether, in which tannic cesses of analysis. The ordinary method of examining now have a reputation as remedial agents owe their serous fluids was followed in the analysis of the value to tannic acid, but the chemical composition blood. "The freshly defibrinated blood was precipi-Careful examinations of the various organs and secretions showed that only the urine, genito-urinary apparatus and the alimentary canal gave any reactions at all.

The only remaining method left by which to determine the forms in which tannic acid is absorbed, was by examination of the urine. Dr. Stockman confirms Lewin's observation that the amount of tannic acid excreted in the urine of rabbits is always considerable. Gallic acid is also invariably found, both being in combination with alkalies. The details of his method of analysis may be interesting. "The urine was distilled to a scrapy consistence either in vacuo, at a temperature of 110° to 120° F., or in a carbonic acid atmosphere. The residue was shaken up with alcohol, the whole filtered, the filtrate mixed with various impurities. When dissolved in naturally suppose that neutral gallate of soda would its conversion into gallic acid. amount of gallic acid in the urine. The observa-centre in the medulla. tions on man were conducted in a similar manner, and long time, without obtaining any bluish coloration

The by the acetic ether), the precipitate being soluble in circulation of salt solution containing gallic acid lactic acid and alkaline carbonates. It also gives a through mammalian blood-yessels also causes them copious blue-black precipitate with ferric salts, not to dilate. But when gallic acid is added to blood it clearing up on boiling." This method has the ad- becomes neutralized, and if the blood be circulated vantage that it is carried out at a low temperature, through an organ, either slight dilatation or no effect and oxidation is thus in a great measure prevented, at all is produced on the calibre of the vessels. In From experiments on dogs it was found that when the experiments the dilatation was in all cases so pure uncombined tannic acid was given there was slight that it might be attributed either to accident, generally found in the urine only gallic acid, with or, more probably, to the addition of the gallic acid sometimes a varying, but always small, quantity of diminishing the alkalinity of the blood. Though it tannic acid. Whatever pyrogallic acid may be pre- has been generally assumed that tannic acid consent cannot be detected by ordinary test for it. But tracts blood-vessels, the experiments made by Dr. if tannate of soda be given a large quantity of tannic Stockman show that dilute solutions act exactly like acid will be found in the urine, along with a smaller dilute acids, and cause vascular dilatation. Solutions quantity of gallic acid, pyrogallic being also absent of catechutannic and rhatany tannic acids, made with in this case. Dr. Stockman's explanation of this is saline of the strength of 1:7500 to 1:1500, caused as follows: When uncombined tannin reaches the distinct dilatation. With such solutions it is somestomach (the contents of which are acid), it com- times possible to recover vessels which have been bines with the albuminous matters present to form tan- contracted by the circulation through them of alkanate of albumen, only a minimal quantity combining line solutions. From the fact that gallotannic acid with alkalies to form alkali-tannate. In the alkaline in- is insoluble in sodium chloride solution it is difficult testine, only such of it as has escaped combination to investigate its action; for when it is added to the with albumen is free to form alkali-tannates. The tan-saline it is immediately precipitated, and in the cirnate of albumen thus formed is absorbed from the in-culation solid particles come in contact with the testine with difficulty or not at all, and hence, re- vessel-walls, thus causing contraction at once by mains there a comparatively long time, thus afford-coagulating the albumen. Still, in spite of the diffiing ample opportunities for the conversion of the culties attending the experiments with it, it is proper tannic into gallic acid, in which latter form it is to draw the conclusion that its action is similar to absorbed; the greater part being, however, excreted that of other varieties of tannin; and experiments by the bowel. When, on the contrary, tannate of on the excised sheep's kidney show that when the soda reaches the stomach, the chemical affinities chemical affinities of tannin are satisfied it has no of the tannic acid are already satisfied, and it is action on the vessels. Dr. Stockman's experiments rapidly absorbed into the blood, thereby affording with hypodermatic injections of tannic acid showed much less time for its sojourn in the intestine, and that it does not produce the effect stated by Fikent-Hence the large scher—that hypodermatic injections cause contracamount of tannic acid and the relatively smaller tion of the arteries from stimulation of the vaso-motor

What, then, is to be said of the therapeutic value gave exactly similar results. Tannic acid may be of vegetable astringents? In regard to gallic acid; given to man in considerable quantities and for a it has no other action than that of a weak inorganic acid, either locally or when absorbed, and cannot be on the addition of ferric salts to the urine. The said to have any special action as an astringent. It fact that pyrogallic acid was not obtained in any does not lessen the calibre of vessels, either by pericase seems to show that it is not formed in the body. pheral or central action; and the fact that it does not Experiments with gallic acid showed that it has a precipitate albumen when used locally shows that it dilating action on the blood-vessels; and that it has has no influence on catarrhal inflammation. It does the power of dilating them again after they have diminish the alkalinity of the blood, and thus inbeen made to contract by the circulation of a weak creases its tendency to coagulate; but stronger acids alkaline solution through the frog. As alkalies con- act in the same way, and more powerfully. "As re-

complicated. Locally applied, its action for good depends on its power of precipitating albumen, the layer of tannate of albumen which is formed acting as a protective to the underlying mucous membrane. To this action is due its value in catarrhal inflammations of the alimentary canal, and in discharging surfaces generally. Its usefulness is limited to such cases, and as a remote astringent it is valueless. In weak solution, and uncombined, its action on contractile tissues, such as the vascular walls, is simply that of a dilute acid, while it is only when stronger solutions are used (much stronger than can ever exist in the blood, even if it were not in combination there) that its power of precipitating albumen comes into play. When its chemical affinities have been satisfied it is no longer capable of precipitating albumen, and therefore exercises little or no influence on the parts with which it comes in contact." The very small quantity in which it can exist in the blood at any one time also precludes its having any marked remote action; and as it is excreted by the bowels and kidneys, it can scarcely exert any effect on other mucous membranes, as the bronchial. Finally, while it is conceivable that it may have some influence in albuminuria, this is to be regarded as very doubtful; and the reported cases in which it has been used and careful measurements and analyses made confirm this doubt.

W. C. WILE, M.D., Editor of the New England Medical Monthly, has been appointed to a Professorship in the Medico-Chirurgical College of Philadelphia, and makes his future address 1006 Walnut Street, in that city, from which he will continue to edit his journal, as heretofore. Dr. Wile is one of the most active and talented members of the New England profession, and the Medico-Chirurgical College, though the youngest of the regular medical schools of Philadelphia, is nevertheless organized on a full graded system of instruction, and manned by a Faculty as worthy of the confidence and patronage of the profession as are her older competitors.

THE INTERNATIONAL MEDICAL CONGRESS OF 1887 AND TRANSATLANTIC STEAMSHIP FARES.—On the last page of The Journal of February 5 we gave a card from the Chairman of the Committee of Arrangements, Dr. A. Y. P. Garnett, giving information concerning liberal arrangements with several of the steamship lines, and the following appropriate acknowledgment should have been appended to the card: "The Committee wish to express their thanks to Mr. Edward Droop, of Washington, for his active interest and efficient aid in consummating this ar- eral days earlier than that usually assigned. When, rangement."

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, January 12, 1887.

THE PRESIDENT, Jos. TABER JOHNSON, M.D., IN THE CHAIR.

H. M. Cutts, M.D., Secretary.

Dr. D. S. Lamb presented

A PORTION OF THE ILEUM, WITH PERFORATION, FROM A CASE OF TYPHOID FEVER.

This specimen consists of a portion of ileum removed about 1½ feet from ileo-colic valve. It contains several Peyer's patches, all of which show slight thickening. The lowermost one is thickened, ulcerated and perforated. The ulcer is irregular in outline, edges slightly undermined; the base shows muscular fibres. The perforation is one-eighth inch in diameter; peritoneal surface of specimen plastered with pseudo-membrane. The case is one of typhoid, or perhaps more properly *enteric*, fever. The patient was a white man, age 29; had been perfectly healthy until this sickness. After several days malaise, typhoid fever was diagnosticated. He died ten days afterwards. The disease appeared in all to last two weeks. Temperature, taken twice daily, ranged from 102° to 104°. Symptoms of perforation occurred the day before death. The attending physician, for whom I made the necropsy, was unable to arrive at the cause of the disease. The post-mortem examination showed the body well nourished, lungs and heart normal. There was dirty, malodorous liquid in abdomen; some flatulent distension of stomach and intestines; intestinal peritoneum reddened, and in right iliac region plastered with dirty looking lymph. In lower two feet of ileum some Peyer's patches were nearly normal, others thickened and irregularly ulcerated; and one of them ulcerated and perforated, as described. Small ulcers in cæcum and vermiform appendix; liver normal; gall bladder ulcerated and contained over eighty gall-stones with facettes; spleen large and soft; kidneys normal.

According to Murchison, quoted by Fagge, peritonitis occurs in three per cent. of all cases of typhoid fever, and in nearly twenty per cent. of all deaths from the fever. The cause of the peritonitis is usually, as in this case, a perforation of the ulcerated Peyer's patch and escape of the intestinal contents into the peritoneal cavity. The perforation is most often excited probably by a sudden movement of the patient, as vomiting, straining, rising up; or by flatulent distension of the bowel, enemas, etc. The indication is, of course, to prevent so grave an occurrence by insuring the utmost quietude to the patient. And since perforation occurs sometimes in cases called mild, the patient perhaps walking about, the necessity of absolute rest is the more emphatic. In this particular case the date of perforation is placed at the end of the second week, which is sevtain the precise date of beginning of the disease, the cial stricture would be likely to follow. actual date of perforation becomes doubtful. The fact that many Peyer's patches in the lower ileum cian could not find the cause of this particular case were but little thickened, while scattered among of typhoid, not that the specific germ of the disease these were others ulcerated and one perforated, seems was not known. to confirm the theory that usually all the patches are not involved at one time, but with some hours or phoid perforation has been done, but he cannot now days of interval between. The fever, depression and recall where he has seen the report. He thinks the danger are doubtless greater when all the patches diagnosis of perforation easy, and that laparotomy are involved at the same time. But few cases recover would be justifiable. after perforation in typhoid fever. It is quite likely that laparotomy has been tried in some cases, but I have not looked this up, and from what we know of CAN THE CESAREAN SECTION SAFELY SUPPLANT CRAthe disease I should not expect healing to take place. I regret that the attending physician has not found it convenient to furnish a history of the case.

Dr. S. C. Busey remarked that as Dr. Lamb bad brought up the question of laparotomy in perfora- upon the masterly manner in which he handled the ject discussed. Neither Dr. Lamb nor himself could senting his figures. Two years ago, he said, he read recall an operation with this in view. DOMESTIC CORRESPONDENCE

"ELECTROLYSIS IN UTERINE FIBROIDS."

Dear Sir :- In Dr. Cutter's letter of last week, "Electrolysis in Uterine Fibroids," I am indirectly criticised for remarks that I wish to modify somewhat as far as they concern me. Dr. Belfield's remarks on my article, "Electrolysis in Gynecology, with a Description of Dr. Apostoli's Method," were quoted by is moist and clearing, the fetor is subsiding and the Dr. Cutter, and these remarks made me appear to appetite is improving. In fact, the child is consay, "During the last twenty-five years various at- valescing. tempts have been made to reduce fibroids of the uteused in an ignorant, inaccurate and bungling way." I do not wish to be understood as saying, "yet none of them have been recognized as being successful," because I have reported successful cases within the last two years of my own, and have also quoted successful cases of other operators. Neither do I wish

2. There are as many forms of septic salpingitis as diseases, has been by many, for some unaccountable there are forms of traumatic infection, and of mi-reason, greatly misunderstood." This statement, while it does not differ widely from the remark There is, however, an additional reason why Law-quoted, is somewhat modified and not nearly as

Dr. Cutter, I am sure, will agree with me, after Medical News, April 24, 1886, he does not believe having had sixteen years' experience with this method in sepsis, at all, does not believe in infection, denies of treatment, that there is a great deal of ignorance the principles on which the practice of modern sur- abroad in regard to the principles it involves. He gery and obstetrics is based. He has been taught must also admit that improvements in the methods of nothing by the researches of Semmelweis and Lister, electrolytic treatment have been rapid, and that with Pasteur and Koch. And why? Because his own the new improvements in electrodes and means of success in combating septic infection is to him proof measurement of the current, its usage is rapidly re-

Within the last three years I have been able, by Without taking the trouble to refute them scientificadopting improved electrodes, to increase the maxically, I but wish to call to mind his assertion that mum strength of current used through a fibroid tumor menstruation does not depend upon the ovaries, but without causing pain enough to require an ancesupon the tubes; that the mortality of the Casarean thetic, from 25 milliampères to 10 ampères—and this operation is still 9923 per cent. His denial of trau- with one surface electrode. All who are acquainted matic infection is a statement of the same kind. I with the history of electrolysis in the treatment of should like to hear Lawson Tait's answer to the fol- fibroid tumors will concede to Dr. Cutter his claim of priority in that field. CASE OF GANGRENE OF THE MOUTH.

Dear Sir: — I desire to report the following case: Stella S., æt. 4 years, was attacked with Lawson Tait disputes the correctness of our teach- gangrena orum on December 22, 1886. A gangrenous condition presented itself over all the visible part of the mouth, including the lips. There was fever, rest-lessness, loss of appetite. The face had a livid, sunken appearance. The discharge from the mouth was fetid and had the ante-mortem odor. The mouth finally presented a brownish black and dry appearance, with black ulcers on the lips. The mouth and lips often bled. I put the child first on tinc. of chloride of iron and chlorate of potassium, and washed the mouth with a saturated solution of chlorate of potassium. No improvement took place until Christmas day, after I had changed the chlorate of potassium wash for a wash of bromo-chloralum, 5ij to the pint of water, and to day, December 31, the mouth

About the time I commenced the solution of brorus by the galvanic current; yet none of them have mo-chloralum I had a powder of subnitrate of bismuth been recognized as successful; because, doubtless, as blown through a quill into the mouth of the child. I Dr. Martin very properly says, the current has been think the bromo-chloralum is worthy of trial in these cases of gangrene of the mouth. J. M. Batten.

309 Fifth Ave., Pittsburg, Pa., Dec. 31, 1886.

SECRET REMEDIES.

Dear Sir: -In The Journal of January 15 is a to be quoted as saying, "the current has been used communication from Dr. Amos Sawyer on "Rumex in an ignorant, inaccurate and bungling way," because Acetosa" as the probable secret remedy used by it is not what I said, although I do not impute to the traveling cancer doctors for taking out tumors. His author of the remark any intention to misquote. falling on the article used by chance reminded me of What I did say, however, was this: "Unfortunately, a secret with which I was entrusted some two years the term electrolysis, as applied to the treatment of since. I had operated on an old gentleman for cat-

aract, and one day, when visiting him, he told me if he received sight from the operation he would give me two valuable recipes: one a sure cure for cancer, the other a never-failing cure for all kinds of sore eyes. To sum up the results of the operation, I got College. Chicago, was on Wednesday made the rethe recipes. Here is the one for cancer: Gather the leaves of the common sheep sorrel, bruise them by pounding, and press out the juice; put the juice in a thin layer in a wide and flat-bottomed new tin pan and set in the sun; when evaporated to the consistency of honey, scrape up with a knife and spread on a piece of cloth large enough to cover the cancer, and bind it on. For two or three hours the pain will be intense, but will then subside. In twelve to twenty-four hours, according to the size and depth of the cancer, it should be taken off, and the cancer will be found loose to its *roots* and will readily come out. He claimed to have seen it used successfully a number of times, and never knew it to fail. Of course, diagnosis was a small matter with him; the cure was all he wanted.

On speaking of this one day to one of our old and respected physicians, he told me he saw this same remedy tried twenty-five or thirty years ago. A pasheep sorrel. He consented and it was applied. The cancer failed to come away and the patient finally died from it. According to the above formula, would not oxalate of tin be the product? Might it not be well to experiment a little along this line? I write remedies sometimes are. Very truly,

MISCELLANEOUS.

Dr. J. Adams Allen, President of Rush Medical cipient of a handsome present from the students of the College. The doctor had entered the class-room for the purpose of delivering his usual lecture when L. E. Tifft, one of the students, interrupted the routine proceedings, and on behalf of his fellow-students presented "Uncle Allen," as the doctor is familiarly called, with a "tripod," consisting of a fat, chubby hand, made of solid gold. The thumb and little finger of the hand were bent so as to touch, the remaining digits being extended. The hand was set on a small block of alabaster, and this, in turn, on a base of black onyx. On the onyx was a solid gold plate bearing this inscription:

> UNCLE ALLEN'S TRIPOD. Remember these three When we practice the art: The condition of blood, The nerves, and the heart.

The quotation is a verse of a college song based tient of his had cancer, and friends urged a trial of on some of Dr. Allen's sayings, and the position of the hand is a favorite one with him when addressing the students. The doctor was greatly surprised on receiving the present, but managed to thank the boys in a way to make them feel happy. He sails Saturday next for Europe, to be gone until September, and this, also, to show Dr. Sawyer how widespread secret this presentation was a token of the good wishes of the students.

> THE Governor of New York, in his annual message, has called attention to the practice of adulterating drugs, and denounced it in appropriate terms. Governors of the other States might follow his example with advantage to the profession and the people.

THE AFTER-TREATMENT OF CATARACT EXTRAC-TION AND IRIDECTOMY ACCORDING TO DR. MICHELL'S METHODS.

> BY T. E. MURRELL, M.D., OF LITTLE ROCK, ARK.

after extraction of the lens and after iridectomy, together with the non-exclusion of light from the eye a small opening at the inner canthus to allow the at any time subsequent to the operation, was brought escape of tears. I don't know whether he uses a dark before the general profession of the country for the room or not, but he could not more effectually exfirst time in St. Louis last May, in the Section of clude the light than by the above dressing. In the Ophthalmology of the American Medical Association. August issue of Progress, Dr. Dudley S. Reynolds, As might be expected, it created no little surprise. of Louisville, Ky., puts in a claim in the following Opinion was divided as to the propriety of such seem words: "The use of the bandage after extraction ingly extreme measures. Dr. Chisolm said, for one, of cataract has long since been abandoned by the he would test it. How many others have made a writer. Instead of this useless and sometimes dantest of it 1 know not, but it is somewhat surprising gerous form of dressing, a little dry absorbent cotton, that so little literature on the subject has thus far secured by strips of adhesive plaster drawn from the appeared. Evidently few have ventured to put the cheek to the forehead, answers a better purpose." been written in commendation of so valuable an ac-Inot regarded the light, he would not have omitted Journal of Ophthalmology, June number, Dr. Chis- strong points in Dr. Michell's methods. Dr. Reyin the third number of the Archives of Ophthalmol- measure certainly belongs to Dr. Charles E. Michell. ogy for 1886. He has been too modest in bringing In my former experience after extraction I had this matter before the world; besides, I regard it so much trouble with slow convalescence, and long-convaluable as to have made it his duty long since to tinued photophobia oftentimes; and, in addition, have done so. As for myself, I am willing to sub-quite a large percentage of iritis of a mild grade, scribe to Dr. Chisolm's strongest commendations, which usually made its appearance after the fifth having used no other after-treatment in extractions day. None of these have troubled me with the new and iridectomies since last May, when Dr. Michell after-treatment, and I now feel quite sure that the very kindly gave me in person all the details of the majority of iritic inflammations were the result of treatment. Nothing can be more simple, and nothing exposure of the eye to a bright light at the time of more sensible.

coming in. One writer asserts that for fifteen years used to go through the eye wards in Baltimore and

bandages. He is not alone in this. Some of the English and Continental surgeons have been in the habit of dressing the eye after extraction with strips of adhesive plaster, but they were very careful to keep the patient in a dark room. See "Wells on the Eye," third edition, p. 268; "Haynes Walton on the Eye," third edition, pp. 788-89, and other works that might be cited; some preferring the compress bandage, some the adhesive strips. As I understand, Dr. Dr. Charles Michell's method of dressing an eye Levis' dressing consists of a piece of black courtplaster completely covering both lids, leaving only matter to the test else, I think, more would have He makes no mention of a dark room, but had he quisition to ophthalmic surgery. In the American putting in his claim here also, since it is one of the olm reports sixteen cases in which he used Dr. nolds dressing defeats two important features in the Michell's after-treatment with most flattering results. after-treatment under consideration, viz.: the filling Again, in a more lengthy report in the N. Y. Medi- in of the orbital space with cotton heats the eye, excal Record, of July 31, he further comments on the cludes the light, and precludes the daily inspection after management of extractions, and adds other of the lids without disturbing the dressing; and seccases from which he draws conclusions more firmly ond, the play of the facial muscles would certainly confirming his faith in the safety and advantages of disturb the equilibrium of the dressing through tracthe innovation. Dr. Michell very modestly gives an tion on the adhesive strips. These, the two strongaccount of how he came to adopt this dressing, and est claims yet put forward, speak for themselves, to allow the patient abundant light after extractions, while whatever honor may come of this valuable

ore sensible.

As would be expected, claims of priority are now caused a flow of tears.

The first examination. It was always painful at decreased a flow of tears. Well do I remember how I or more Dr. Levis, of Philadelphia, has discarded in New York with the surgeon to dress the eyes opto change the dressing. And when I began practice tember 29 I removed the lens and its capsule. The I followed in my preceptor's tracks, and carefully after-treatment was the same as before. No pain at excluded every ray of light. I came to notice, how- any time. On the eighth day removed the plaster ever, in the course of time, that the more effectually and gave her the liberties of the house. There was the light was excluded the more intense and the more union by first intention, a clear black pupil, and not persistent the photophobia; hence I came gradually the slightest trace of iritic engorgement. The effect to be less careful of utter darkness, until I had come of full daylight was not at all disagreeable from the using the cotton and bandage dressing over the eyes. ination revealed a fluid vitreous with floating opacia piece of black goods over the bandage, but I found but moderate vision. they seldom called for this. On hearing, therefore, ple treatment, a few cases from my record book:

right lens, leaving a thick calcareous capsule. Dark ned for fully a month, and it was after two months trade—type setting. or more that she could tolerate full daylight without lens in its capsule, which was also treated with bandage and dark room, and was followed by a like train of iritis and long continued photophobia. These operations were performed last winter and spring. In September of this year I extracted the calcareous capsule from the right eye. It was a dense hull of lime salts so thick that it crushed like egg shell. large corneal section was made and the mass seized with forceps and withdrawn. Both eyes were dressed with a narrow strip of isinglass plaster just long enough to catch well on the two lids and hold them together. The room in which she stayed had two large east windows without blinds, curtains or shades. and I directed that none be put up. The walls be ing white, the light in the room was very bright. The morning sun shone in her face and she found it more comfortable to put a screen between her face and the window until the sunshine had gotten off of her bed. No other discomfort was complained of. On the fifth day the left eye was turned loose, and on the seventh day the right. She was at once given the liberties of the house, and on calling to see her the next day I found her walking in the yard barehead, with a bright sun overhead, utterly indifferent to the light. There was no iritis or photophobia at any time.

Case 2.—Mrs. R., æt. 81. Hyper-mature cataract in the right eye, dislocated downwards fully one-third, its diameter; fluid vitreous.

with narrow strips of isinglass plaster and full day Medical College before the class, removing the right light allowed in the room. Six days later liberated lens. Operation smooth. A narrow strip of plaster both eyes and let her go where she pleased. A mild to close each eye. After the operation he walked conjunctivitis ensued, but there was no photophobia down stairs and sat by a stove nearly an hour, waitwhatever. The result of the iridectomy was not sat ling for some way to get home. Finally a wagon isfactory as regards vision on account of a filmy called and he got in and rode to his home, more than

erated for cataract, with candle in hand, to see how opacity above the periphery of the lens; so on Septo using a well lighted room for the patient, and only first exposure of the eye. Ophthalmoscopic exam-I always directed, if the light was too bright, to put ties from former choroiditis, and of course there was

V= perception of light. Extracted the mation, no discomfort of any kind. He was out in the bright sun in less than two weeks, and remarked room and bandage. Ten days later removed the that daylight seemed brighter to him than it ever did bandage permanently and put on a shade for the in his life, much like being near an electric light; There was some iritis at this time, which soon but it was not at all disagreeable, and caused no irrisubsided, but the most intense photophobia contin- tation of the eye. He soon went to work at his

Case 4.—Mr. Y., &t. 60. Is nearly blind in his discomfort. Some months later I extracted the left left eye from old choroiditis, and has immature cataract in his right eye, with which he can still count fingers readily at four feet. I determined to operate. On September 12 I extracted the right lens, taking pains to remove as nearly as possible all the cortical substance. Closed the eyes with a strip of isinglass plaster on each, and directed that the window blinds be left open and the curtains kept up. Before leaving the room I noticed that the lids of the right eye had not been drawn closely together, sufficient space intervening for me to see the cornea. I did not interfere, however, as Dr. Michell had told me he frequently left a small space between the lids on purpose to allow the easy escape of the tears. When I called the next day the patient exultingly told me how he lay in bed and counted the bars in the window frame, and his fingers at arm's length, and saw across the street with the eye that had been operated on. As all was going well, I did not disturb his recreations.

> On the sixth day I turned his eyes loose, and on the eighth day he walked to my office, underwent a thorough ophthalmoscopic examination and test for glasses, and took the train for home, one hundred miles distant. I received a letter from him a few days since, saying his eye had never given him a par ticle of trouble. I never saw so little restraint after operating for cataract as in this case, nor did I ever see smoother healing.

Case 5.—G. W. Negro, at. 70. Cataract in both July 22, made an upward iridectomy. Lids closed eyes, mature in left. November 6 operated at the

CASES OF POISONING FROM THE EATING OF DRIED BEEF.

BY R. HARVEY REED, M.D., OF MANSFIELD, OHIO,

On July 31 I was called to the family of Mr. James by insomnia, and nothing has ever given such de E., living at 92 East Market St., and found all the cided relief as a course of hearty meals just before members of the family then at home, sick with a pegoing to bed. When the temporary insomnia has culiar line of symptoms, of a similar character. I been relieved by this, I continue the sponge baths at once suspected a toxic agent of some kind, and and exercise before going to bed; but sleeplessness on inquiry found my suspicions well grounded. The often returns after a sustained degree of mental family consisted of Mr. E., aged 67, Miss E., aged labor and excitement, and is almost immediately re- 21, James E., aged 16, and Mrs. E. (age unknown); lieved by a generally hearty meal before going to the last being away from home at that time was not bed. At 19 years of age, while a student of meditaken ill. Upon further inquiry I found they had all cine, I was dosed for this condition with every then been in their usual health the day before (July 30), known hypnotic, without any perceptible effect, on the afternoon of which day they had bought some

Miss E., a rather delicate young lady, was taken violently ill about 8:30 o'clock on the same evening, acid; sp. gr. 1020. No albumin and no sugar, and first vomiting the contents of the stomach, after which but few earthy phosphates or deposits of any kind. the emesis still continued throughout the night, the patient throwing up a greenish, frothy mucoid sub- acid; sp. gr. 1028. No albumin and no sugar, but stance, which came up in great quantities. She had large quantities of earthy phosphates, and the chlomarked thirst, with constriction of the fauces and rides. great prostration. Shortly after the vomiting commenced the bowels began discharging, and would use of opium and bismuth, together with lime-water move every time she vomited; the discharges con- and milk, with stimulants and diuretics, followed with sisting of a brownish liquid substance. This was as-tonics and pepsin; while locally were applied heat sociated with more or less griping.

A homeopath had been consulted in the evening, but considered it a case of cholera morbus and treat- felt as well as ever. The young lady was several ed it accordingly. The patient not improving as days in making a recovery, and did not get over the desired, sent for me the next morning, at which time effects for almost a fortnight. Mr. E., Sr., did not I elicited the above history, and found the patient entirely recover from the effects of the poison for with a fiery red tongue, a bitter taste in the mouth, more than two weeks. They were all troubled more vertigo, twitching of the muscles, cold extremities, or less with indigestion and constipation for some no fever, and with a pulse of 120, and very much time after they had recovered from the primary efprostrated. With others of the same family suffering fects of the poisonous ptomaines. in a similar manner, and the associated history, I

result of eating poisonous beef.

of July 30, but being a very strong, healthy young reported finding the ptomaines. His full report is lad, was not taken sick until after breakfast the next morning, at which time he ate still more freely of the same dried beef. In about an hour and a half he was taken with severe vomiting, which continued from Dr. Reed, Mansfield, Ohio. Determination of for several hours, but was not followed with any considerable diarrheal discharge, although the bowels analysis—described by Selmi. were moved quite freely. He complained of a bitter taste in the mouth, with a deathly sickness and weakness, and vomited a peculiar mucoid substance, after discharging the food contained in the stomach; his croscope. The method of analysis is described in pulse was 88, and not associated with fever.

James E., Sr., ate but little of the beef for supper, but said he had had a bad taste in his mouth all Leech, of Columbus, for microscopical examination, night. He was not taken sick until after breakfast, at which time he ate of the beef more freely, and in of the meat himself, which revealed in both instances about an hour and a half was taken violently sick; degeneration of the muscular fibres, with myriads of first with purging, which was soon followed by vio-micrococci. lent vomiting, first of the contents of the stomach, and then of a greenish frothy mucoid substance M. and son Claude, the former aged 42 and the latter which was very tenacious, and would string out from 17. They had bought and eaten a lot of dried beef, his mouth to the floor like white of egg; the tongue and in the course of an hour or more were taken viowas fiery red and covered with slime. Dr. Barnhill also sent some of the meat to Dr. besides making a careful microscopical examination

On August 5, 1886, I was called to visit Mrs. John

Mrs. M. was taken with vomiting and purging; He had great difficulty in urinating, the urine being ed, had cold extremities, with vertigo; the tongue

> Claude M. was taken ill very shortly after eating Specimens of the urine were se-lited large quantities of a ropy mucoid substance;

The treatment in these cases was the same as in Miss E.: Color, light straw; reaction neutral; sp. the others, with the exception of using small doses of gr. 1022. A trace of sugar was found, but no albu-calomel instead of bismuth, on the principal of it

I considered both of these cases the result of eating poisonous dried beef; although not quite so severe as the cases of the Ewing family. The young man soon recovered and in a day or so was all right; but Mrs. M. was several days regaining her health, professor of anatomy and physiology in the american medical and in fact the arithment of this report). and in fact is still (at the writing of this report) troubled more or less with gastro intestinal icritation.

mens of this meat.

Remarks.—That the ptomaines or cadaveric alkaloids were the cause of the illness in the above cases is without a question in the case of the Ewing family, and scarcely without a doubt in the last two cases. That there is a poisonous alkaloid which is liable to form in meat, under certain circumstances, has been established without a doubt; but the question of chief importance to the public in general is, when, and under what circumstances, these poisonous ptomaines may and do form, and how to prevent their formation.

When it is remembered that these poisonous alkaloids were first discovered by Selmi in exhumed leader Chosroes. They are, therefore, Caucasian corpses, the key to the mystery is at our command; chemistry has unlocked the door that led to their once mysterious approach, and has shown their presence to be synchronous with the decomposition of size and antiquity of this collection, it can hardly fail meat of any kind. This being the fact, all tainted of being a valuable one. The great traveler and meat, from whatever source, should be strenuously writer, H. B. Tristram, once on looking at it said: avoided; the "shop soured" meat that has spent days on the counter, or in the ice chest, should be ciety might envy, and out of which they might select shunned, even when cooked and canned, or when as many types as it suited their fancy to create." made into bologna sausage, or pudding meat, or salted or dried; for it must be remembered that no amount of cooking or curing will remove these poisonous ptomaines from meat in which they have once formed. They are not like the trichina spiralis, or the cysticercus, which can easily be destroyed by thorough cooking.

large cities or packing houses, is another source of the occiput to the starting-point. these ptomaines; the rapid and slip-shod methods meat is turned out upon the market in a few days as cured (but which, in reality, has not been cured sufsult the formation of these poisonous alkaloids), should not only be shunned, but these "near cut" and imperfect methods of curing condemned; and no process of curing and packing meat should be permitted that does not insure the most perfect preserving of the same; and no meat should be put little openings at the base of the skull, then filling through any preservative process of any kind that is its interior with mustard seeds, which are then poured not perfectly healthy, "sweet meat" to begin with, out and measured in a graduated vessel. that is not absolutely free from any taint or decomposition.

The detestable habit of working up beeves that have been killed by railway accidents, and have not been bled or dressed for days after being killed, and the wholesale slaughter of "bony old cows" and "unborn calves" and placing them on the market for food, is a disgrace to any country.

MEASUREMENTS FROM SKULLS OF THE SEVENTH CENTURY.

BY C. F. DIGHT, M.D.,

During a recent visit to Jerusalem, Palestine, I had I regret very much my inability to procure speci- an opportunity to examine and take the measurements of a large and rare collection of human skulls, which are stored away in the old monastery of Mar-Saba, a distance of three hours' horseback ride down the Kedron Valley, midway between Jerusalem and the Dead Sea. The results of this examination are such as are believed to be of interest, and for this reason 1 am led to publish them.

> These skulls are said to be those of the early Christian monks, who in the fifth and sixth centuries lived in great numbers along this Kedron Valley, as far down as the Dead Sea, and also in and about Jerusalem, who in 614 were massacred by the Persians, when they invaded Syria and Palestine under their skulls, and probably those of the ancient Greeks and Romans, which were gathered up and stored here to the number (they say) of 10,000. Such being the "It is certainly a collection the Anthropological So-

> The measurements which I will give are the only ones, so far as I have been able to ascertain, that have ever been taken of any of these skulls. Omitting as far as possible anatomical terms, the five measurements which I took are as follows:

1. The horizontal circumference; learned by measuring with a tape the distance from the middle of the The commercial process of canning meat in our lower part of the forehead around the largest part of

2. The naso-occipital length, or the distance from resorted to by the most of these houses, by which just above the root of the nose, back over the top of the head to the external occipital protuberance.

3. The height, or the vertical distance from the ficiently to prevent its decomposition, and as a re- opening of the ear to the level of the centre of the top of the head.

> 4. The width, or the greatest distance through the head from side to side above the level of the cheek

> 5. The cranial capacity, learned by closing the

Of the ninety-one skulls which 1 measured, the largest one gave a horizontal circumference of 22.45 inches (570 millimetres), which is 34 of an inch above the average for all races. This same skull gave a cranial capacity of 113.6 cubic inches, which is 28 6 cubic inches greater than the average for all races, and 18.1 greater than the average for the Caucasian race (whose cranial capacity exceeds all other races), and but 4.4 cubic inches less than the capacity of Cuvier's skull—the largest on record. Its width was also the greatest, being 6.38 inches (162 mm.).

Its naso occipital length, 13.39 inches (340 mm.), skulls, and probably all males, and that among this inches (120 mm.).

the portions of this brain had been very small.

occupital length of 11.85 inches (301 mm.).

wards.

8.94 inches (227 mm.), gave a horizontal circumference of 19.7 inches (500 mm.), height 4.37 inches (111 mm.), and width of 4.92 inches (125 mm.).

The average measurements of the ninety-one skulls are found to be as follows:

Average horizontal circum...... 19.98 in. (507.2 mm.). naso-occipital length.... 11.84 in. (300.6 mm.).

The average cranial capacity of the nineteen whose

should have skulls above rather than below the average), it follows:

1. That ours, the Cancasian skull, has, during the in height, and not at all in width, and has gained in cranial capacity 3.7 cubic inches.

- 2. From the fact that our skulls have not gained in width, it follows that this gain in capacity of 3.7 cu. in. is due to increase in their height and length, which, bearing in mind the plan of development of the brain, implies an increase in size of the upper and the antepriori grounds, we should expect to increase by edufunctions.
- which specially preside over the selfish propensities, or the so called interior functions, and which give of our wives, our children, and our families. breadth to the head, being called into activity less as skulls.

was reached by but one other, and its height was 4.72 large collection numerous abnormalities and peculilarities exist—such as absorption and perforation of The smallest of the ninety-one skulls gave the both tables of the skull from growth and pressure of smallest horizontal circumference 18.91 inches (480 the Pacchionian bodies; non union of the two halves mm), and a cranial capacity of 76.6 cubic inches, of the frontal bone in the usual way, leaving a perwhich is 18.0 cu. in, less than the average Caucasian sistent frontal suture; marked difference in size of capacity. Its height was the lowest, being 3.97 inches the two halves of the skull, the left half usually being (101 mm.), its width 5.27 inches (134 mm.), and its the larger; and Wormian bones in different localities. maso-) cipital length 11.42 inches (290 mm.). Many of them yet contain a considerable mm.), gave a horizontal circumference of 20.68 inches number of teeth, which were sound at death, but are (j=2 min.), width 5.63 inches (t43 mm.), and naso- now brittle because of their great age. Others present fractures at different places, and those which The one giving the least width, 4.72 inches (120 are broken open show internal depressions at points mm.), gave a horizontal circumference of 20.48 inches corresponding to external elevations, and vice versa, (520 mm.), a naso-occipital length of 12.21 inches showing that the inside of the skull corresponds in (310 mm.), and height of 4.45 inches (113 mm.), shape to the outside, and that, consequently, the being narrow and low, but long from before back, shape of the brain may, as a rule, be determined by the shape of the head, as certainly as the shape of a The one giving the shortest naso-occipital length, tree may be known by the shape of the bark which

POISONOUS ARSENICAL WALL-PAPERS.

Read before the Section for Clinical Medicine, Pathology and Hygiene, of the Suffolk District Medical Society, January 12, 1887.

> BY JAMES R. CHADWICK, M.D., OF BOSTON, MASS.

In the presence of so many chemical experts and capacities were measured was 91.8 cubic inches. learned general practitioners, it would be presumpt-Comparing the average measurements of these uous in me to treat this subject systematically or skulls with the present average measurements of skulls exhaustively. Moreover, my purpose in opening of the same race (the Caucasian), and if the above this discussion is to present, by fresh instances, to measurements are taken as the average of the race the public and profession, the dangers to which every at that time (and persons of their rank at that time citizen of this commonwealth is exposed by the manufacture and sale of papers for our walls, so charged with arsenic as to produce characteristic symptoms of the poisoning by that mineral in the past thirteen or fourteen centuries, increased in hori- persons occupying the rooms thus papered. The zontal circumference 1.72 inches, and to a less extent Legislature of this State, last winter failed to pass a bill prohibiting the use of arsenic in the coloring of wall papers, so that the only means by which we can save ourselves from this poison, is to disseminate so full an appreciation of our danger throughout the community as to cause every individual to protect himself and his family. This end can only be attained by the publication, by every one who has rior parts of the brain—the exact parts which, on a suffered, of the exact circumstances attending his experience, together with the names of the dealers cation and civilization, since these parts of the brain retailing the papers and the chemists who have specially preside over the moral and intellectual analyzed them. This I shall aim to do without animosity to any individual, but with the single purpose 3. The lower portions of the brain, being the parts of making every one feel more keenly than they now appear to do, the responsibility for the lives and health

In September, 1885, Messis, J. F. Bumstead & education and civilization advance, have failed to Co. put upon my nursery and one sleeping-room grow as rapidly as other and more exercised portions new papers, which they assured me had been of the brain; hence the non-increase in width of our analyzed and pronounced free from arsenic. In the nursery slept a boy of 4 years and a nurse, in the It need scarcely be said that these were adult chamber slept a girl of 13, in a third room, not then

girls yielded somewhat, but never fully, to treatment. During the summer of 1886 they regained their health and strength at Mt. Desert; within a month of their return to their homes many of the old symptoms reappeared. About the first of December, the attacks of colicky pains became more severe and frequent in the two affected girls, and were attended by vomiting and diarrheea.

My attention was then aroused, and I set about to discover a common cause for all these similar symptoms. Having suffered severely in past years from the poisoning of my family by arsenic, I naturally thought of that possibility, and sent samples of the papers most recently put upon the walls (nursery and small chamber) to Professor E. S. Wood for analysis, and received the following reply:

"Boston, December 10, 1886. "The enclosed paper (from the nursery) is very arsenical, I should advise its removal. The other was all right, non-arsenical. EDWARD S. WOOD.

I was naturally in a state of great indignation that, despite my care, I should have put upon the ence whether the symptoms manifested by two of wall of my nursery a paper which contained a dangerous amount of arsenic. I wrote at once to J. F. Bumstead & Co., asking the name of the chemist who had made the analysis for them. The reply was as follows:

"Boston, December 13, 1886.

"Dr. James R. Chadwick:

Dear Sir:—The paper about which you enquire was analyzed by Professor S. P. Sharples, and by him pronounced free from Yours truly, arsenic.'

J. F. BUMSTEAD & Co., per HENRY."

It happened that a week previous to this correspondence my wife had taken a friend to the store of J. F. Bumstead & Co., where he had purchased had no symptoms since the paper in my nursery was several hundred dollars' worth of papers for a newlyerected house in California. On the same evening I questioned my wife closely as to whether she had been careful to select only papers that were free from arsenic. She said she had insisted upon that point with Mr. Bumstead himself, and had been told that only those papers would be shown her which had been analyzed and pronounced to be free from arsenic. I asked if she had inquired who their chemist was, to which she replied that Mr. Bumstead had told her that their chemist was a Professor Hills. As I knew that this could only be Professor Wm. B. Hills, of the Harvard Medical School, I felt as to give one dose in the evening to secure a quiet sured that the papers were safe. A week later, night, in cases of high delirium it has been repeated however, on discovering that my own paper was within four or six hours with advantage and safety. arsenical, and feeling responsible for my friend in If given by the mouth, larger doses are required, as California, I went to the store of Bumstead & Co., much as $\frac{1}{120}$ to $\frac{1}{90}$, or even $\frac{1}{50}$ of a grain given at and demanded to see the reports of Professor Hills bedtime, having proved satisfactory in the hands of upon the seventeen papers selected by my friend. 1 Dr. Wetherill, Jr. In America, 100 of a grain has was told to call the next day when they would be been fixed upon as the average working dose. Mr.

re-papered, slept two other children. All the chil- shown me. I did so, and then found that all the dren passed several hours of every day in the nursery. papers had been, (owing to a misunderstanding) sent During the winter of 1885-86, the boy and nurse re- to Professer Hills for analysis since my visit the previmained in good health, the girl of 14, however, suf-ous day. One of them had been pronounced by fered much, for the first time in her life, from dyspep- him to contain "considerable arsenic," and ansia, colicky pains and headaches; the younger of the other a "small amount," both being regarded two girls had many attacks of palpitation of the as more or less dangerous to health. The others heart, lost color and strength; the other girl kept in were all practically free from arsenic. On asking good health. The symptoms in the two affected upon whose certificates the two first mentioned papers had been supplied as "free from arsenic," I was shown the certificates of Prof. S. P. Sharples.

> In order to confirm the presence of arsenic in dangerous amount in the three papers about which the reports were conflicting, I have since had each of them analyzed independently by Professor E. S. Wood, Professor W. B. Hills, and Dr. Chas. Harrington, all of the Harvard Medical School, with the result of perfect concurrence as to finding arsenic in dangerous amount.

But little comment is needed on this recital of facts. It is, however, but just to Mr. Bumstead to say that I fully exonerate him from any intent to mislead my wife with regard to the analyst of the papers supplied to my friend. His statement that Professor Hills is now his analyst is true, yet I think I am right in pointing out to him that his reply was so framed as to be misleading, because the papers he was offering for sale had many of them, as is manifest, been analyzed in previous years by other chemists.

I may say, in conclusion, that it makes no differmy children be adjudged by those present as due to arsenic or not; if I demand papers free from arsenic I ought to be able to obtain them. My own belief is that the symptoms are attributable to that cause, and that the exemption of the nurse and two other children, though in two instances more constantly exposed to the influence, was attributable to the fact that they were less susceptible to the poisonous effects of arsenic. I pass around samples of the papers with the arsenical mirrors obtained by the Berzelius-Marsh test.

I should add that the two affected children have removed a month ago.

MEDICAL PROGRESS.

HYDRIODATE OF HYOSCINE is recommended by DR. J. MITCHELL BRUCE as being the most convenient salt of the alkaloid for use as a cerebral sedative (Practitioner, pp. 321–333). He finds that it is best administered by subcutaneous injection in doses of $\frac{1}{2\sqrt{0}}$ of a grain. Although it is usually only necessary Freeman and Mr Hardy, of Charing Hospital, have, than the right. There was no alteration in the kneehowever, come to the conclusion that $\frac{1}{2000}$ of a grain jerks, and no ankle clonus. Perhaps the left side of of the hydriodate produces most of the benefit that the head was more sensitive, but no one place could may be expected, without any risk of unpleasant be made out to be more sensitive than another. At effects. Dr. Bruce confirms the results obtained by times the boy said his left arm felt "heavy." The previous investigators as to the little value of hyos- fits were not opisthotonic, as happened in feigned cine as an anti-hidrotic. On the contrary it fre-lifts. Dr. Jackson described three forms of epilepsy quently produces a distinct increase of perspiration. -(1) epilepsy proper; (2) epileptiform seizures; (3) It does not produce unpleasant dryness of the skin due to nervous discharges in the pons Varolii or meand the throat like atropine. The province of the dulla oblongata. In the case above there was a application of hyoscine is defined by Dr. Bruce to local lesion somewhere, as the hemiplegia showed. be in combatting urgent symptoms in cases of de The epileptogenous zone was less defined than oclirium and to procure quiet and sleep. It must not curred in Brown Sequard's guinea pigs. Nervous be expected to cure any disease, although it is true discharge in some part of the pons was the probable that cases have occurred in which symptoms once cause of the falls or fits.—Lancet, Nov. 20, 1886. controlled by hyoscine have not returned. Sometimes hyoscine gives rise to unpleasant symptoms in connection with the circulation and respiration. Within half an hour after the administration of a full dose $(\frac{1}{100}$ to $\frac{1}{75}$ hypodermically) it may cause failure of respiration in the form of shallow breathing, or even Cheyne Stokes' rhythm. It has been found, however, by Dr. G. W. Mann, that chloral can neutralize the effects produced by hyoscine. A lady who had taken $\frac{1}{30}$ of a grain of hydrochlorate of hyoscine by mistake, was seized with convulsions, loss of speech, illusions and hallucinations. Chloral in 10 grain doses was given every quarter of an hour until the convulsions had disappeared which took place in less than an hour from the commencement of the treatment. It was then continued in the same dose every hour, but after 90 grains in all had been given, there was no further necessity for its use.— Provincial Medical Journal, Jan. 1, 1887.

RARE CASE OF EPILEPSY.—At the meeting of the Medical Society of London, on November 15, 1886, Dr. HUGHLINGS JACKSON related the case of a boy, 7 years of age, in whom Epileptic Fts were artificially induced by an unexpected touch on the head. When 3 days old the boy had a convulsion. At the age of 215 years he had an "ordinary" epileptic fit. Of these latter fits he had four attacks of the same kind, or rather degree. Ever since the first so called ordinary epileptic fit some imperfect use of the left arm and leg was noticed, and has ever since remained. to have solved the problem of local anæsthesia in down, but these falls were really fits. He never different strengths, he has found that the soft parts "fell" unless the head or face were touched, but the about the maxillae may be rendered completely infit would not occur if he knew he was going to be sensible by the use of cocaine, associated with a 2 touched. He limped with in eighty seven cases without causing any unpleasant the left leg, which was also less in circumference symptoms.—Medical Record, Jan. 15, 1887.

Pelletierine in Infantile Disorders.—M. F. MÉPLAIN, bearing in mind the difficulty of giving children vermifuge medicine in sufficient doses, and the fact that Dr. Bétancés had administered 6 centigrammes of pelletierine, which had expelled a tænia, resolved to try this remedy on an infant 32 months old, which was suffering from convulsions. Béranger Féraud and other writers recommend that pelletierine should not be given to children, on account of the symptoms of congestion of the brain, which it occasionally causes in adults. Be that as it may, M. F. Méplain administered to his little patient a large teaspoonful of solution of Tanret's pelletierine, which represents about 6 centigrammes of the alkaloid; twenty minutes later, 20 grammes of manna, dissolved in a cup of milk, were given. The expulsion was tardy, owing to the insufficiency of the purgatives used, but was, nevertheless, complete. M. F. Méplain, who remained several hours with the patient, observed no alarming symptom. From the observations of MM. Bétancés and F. Méplain, it appears, therefore, that whilst a small dose of pelletierine is sufficient to expel the tænia, the use of the drug is, in the case of children, unattended with the risks which might have been expected from its physiological action, and from the effects observed in adults.—British Medical Journal, Jan. 1, 1887.

Dental Anæsthesia.—M. Georges Vian claims About the age of $2^{\frac{1}{2}}$ years the boy began to fall dentistry. After numerous trials of solutions of curred in one day, and never a day passed without grammes (10 drops) of the solution, and injects it effective. Several appeared also during sleep when extremity of the root of the tooth. Half of the so-

By a calculation based on the receipts been discussed, and needs still further ventilation, from all sources (including special appropriations) it that a more stringent law should be made regarding special appropriations are required from time to time medical officers are not subjected to examinations as

for extraordinary alterations and repairs for the lournal of the American Medical Association, older hospitals. In the long run the expenses would probably be reduced if the recommendation of General Hamilton regarding a laboratory and warehouse were carried out; for it would undoubtedly be cheaper to manufacture many of the drugs now in use than to buy them; and with ample store-room articles which cannot now be kept in stock could be purchased at better rates, and be subject to more thorough inspection. Certainly, all non-perishable articles needed for use in the hospitals should be kept in stock.

Of the hospitals, the one at Baltimore will probably be occupied this winter; the one at Boston is in bad repair, especially with regard to the heating apparatus; and the one at Chicago is probably in a worse condition. The hospital at Detroit is too small, and that this is a very important station was shown during the small-pox epidemic in Montreal little more than a year ago. It seems, however, that sium battery of six cells is employed; and an inter-the practical working of the instrument might be rupted current with about six hundred interruptions easily demonstrated beyond doubt by experiments

THE LIGHTING AND HEATING OF RAIL-WAY CARS.

The recent disaster on the Vermont Central Railway, and others which have but lately occurred on other roads, seem sufficient ground for again calling attention to the dangerous methods of heating and lighting of railway passenger cars, especially since of the 300 lives already lost in railway accidents in this country this year about one-half have been caused by fires originating from the stoves and kerosene lamps with which the cars are heated and lighted. In a few States the State Boards of Health have undertaken systematic sanitary inspection of passenger cars, and it would be well if the Boards would set this matter before the legislatures in the strongest possible light; since it is clearly within the province of a State Board of Health to take cognizance of such matters—certainly as much as the disinfection of closets, water supply, means for rescuing passengers from wrecks, etc. In Dakota a bill has been presented to the legislature, and we are informed that it will most probably pass, which declares that a fire in a railway car is a "culpable negligence," and renders the road liable to the survivors of the person burned in the sum of \$10,000 damages; and in the Illinois Legislature two bills have been introduced the one requiring railway companies to use some other method than stoves for heating cars, and the other providing that a chemical fire-extinguisher shall be kept at each end of the car, or, in lieu of them, three hand fire-extinguishers.

It has been shown on the Connecticut River Valley Railway and on the elevated roads in New York City, that cars may be efficiently and satisfactorily heated by steam, without fire of any kind in the cars, and without danger to the passengers by breakage or disconnection. On the elevated roads in New York each car contains pipes in which is a quantity of soda solution, which is heated by steam from the engine; this solution being used because it stores more heat than any other available solution.

In the matter of lighting cars, it is now practicable to use the incandescent electric light, which is in partial use on the Pennsylvania Railway and on some of the cars of the Boston and Albany Road. gas, which has been used for several years on some of the roads, is much more safe than kerosene lamps. There may be said to be no danger whatever from the incandescent light, for any accident which breaks the glass bulbs at once extinguishes the light.

shall be superseded by iron bridges with a guard-rail quarantines and military cordons.

(such as is in use on the New York elevated railways)-a high rail on the outside of the track rail on each side, which prevents ears leaving the track even if derailed.

A CLASSICAL PATIENT.

The following message (?) was left on the slate of a Boston physician:

οί αναγραδιοι έμε χρήξουσιν δίκαδε ίέναι.

The physician, in writing to the Boston Medical and Surgical Journal, claims that his inability to translate the line "shows the necessity of requiring Greek" (in the colleges). To us it only shows that the patient should have been taught to express his wants in English.

Doubtless one or two dozen translations of the line (no two alike) have been sent in by lovers of the classics residing even under the shadows of Harvard and the Bunker Hill monument. It is, then, perhaps too late for us to venture a translation, and it would be presumption extraordinary for those who do not see the necessity of requiring Greek, and who are somewhat out towards the periphery of the universe, to do more than offer a diagnosis of the patient's malady. If the patient cannot write English it is scarcely probable that his tongue has no mastery of the words immortalized by Dr. Noah Webster, not to mention other lexicographers. We may therefore imagine the dismay and confusion of face of our enquiring confrère when the patient returns, finds him in his office, and begins to describe his symptoms in the native tongue of Aristotle, which has been more recently brought prominently before the public by Prof. Anthony and Mr. Charles Francis Adams. There is, of course, a possibility that the person who left the inscription on the slate was a Boston blacksmith who called to collect a bill. It is equally possible that what was written was not Greek at all, but a prescription written by a prominent consultant while thinking of something else. But, on the assumption that the perpetrator of the outrage was a patient, we venture the diagnosis of Anglo-agraphic aphasia, and would recommend a writing master and a school dictionary.

CHOLERA IN SOUTH AMERICA.—From the latest weekly abstract of sanitary reports, issued from the office of the Supervising Surgeon-General of the U. S. Marine Hospital Service, Feb. 3, 1887, it appears It is also within the province of the supervisors of that the cholera epidemic is steadily spreading to new public health to recommend that wooden bridges places in the Argentine Republic, regardless of both

PROPOSED AMENDMENTS TO THE LAW REGU-LATING THE PRACTICE OF MEDICINE IN ILLINOIS.

A few weeks since we called attention to the very imperfect returns of births and deaths in this State, as shown in the last general report of the Illinois State Board of Health, caused by the neglect of physicians in reporting cases as required by the law. Some amendments to the law designed to aid in securing more complete returns in future have been presented in the State Legislature, now in session, and we trust they will receive early and favorable consideration.

If the State will furnish the members of the profession in every town convenient blank certificates, both for births and deaths, and annually publish the results in a form accessible for convenient study or reference, most certainly the physicians should be willing to fill the blanks and promptly mail them to the proper town or county officer. Correct vital statistics relating to the population of any town, county or State, constitute necessary factors in the study of etiology and the results of various measures for sanitary improvements. As every physician has a personal interest in whatever will advance any department of the science and art of medicine, he ought to cooperate cheerfully and promptly in securing full and reliable statistics of births and deaths, so long as the published results return free in the form of reports from the Health Board of the State, tabulated and associated with much additional valuable matter, all arranged convenient for use.

Another Death from Chloroform.—According to the daily press, during the surgical clinic of Professor Wm. H. Pancoast in the Medico Chirurgical Hospital, Philadelphia, February 9, 1887, a patient, male, aged 30 years, presented himself on account of false anchylosis of the proximal joints of the thumb and index finger resulting from previous injury. On attempting to forcibly restore motion the patient complained so much, that the professor ordered him a few inhalations of chloroform, and while he was still sensible enough to voluntarily hold up his hand, the professor took it, quickly flexed the joints freely, and removed the napkin in which had been placed at the beginning only "half a teaspoonful of chloroform," but respiration had ceased. The statement gives the whole time during which the chloroform had been administered as "only four minutes;" and that from a napkin admitting free intermixture of performed on the left eye with a view of abating the

air. The most active and persevering efforts failed to resuscitate him. The post-mortem examination revealed much disease of the kidneys, and fatty degeneration of the liver and muscular structure of the heart.

SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, January 17, 1887. THE PRESIDENT, EDMUND J. DOERING, M.D., IN THE CHAIR.

Dr. Lyman Ware read a paper entitled

A CLINICAL STUDY OF GLAUCOMA.

The author briefly referred to the history, pathology and etiology of glancoma, and expressed his belief in the curative power of von Graefe's operation of iridectomy. Unmistakable symptoms of glaucoma are supraorbital and ciliary neuralgia, increased ocular tension, periodic diminution of vision, the appearance of a halo around artificial lights, a sluggish and widely dilated pupil and a shallow anterior chamber. Although increased tension may be associated with other diseases of the eye, its presence should always lead to a critical examination. Several cases were detailed: Mrs. M., aged 50, while riding in an open street car, contracted a severe cold, which was followed by neuralgia over both eyes. The pain was so intense that at times she was delirious. Her weight was reduced from 110 to 80 pounds. She became entirely blind. On account of the eye being small and deeply set and the anterior chamber very shallow, sclerotomy was advised and performed. This gave immediate relief, but the pain returned again in a few days. When Dr. Ware saw the case the anterior chamber was almost obliterated, the glaucomatous lens pressed the iris forward until it came in contact with the cornea. With a von Graefe cataract ki ife a free sclero corneal incision was made and a portion of the iris excised, and the lens removed from both eyes. The pain greatly subsided, but the sight was irrecoverably lost. Another case was a man æt. 52 years, who complained of having had pain in and over the left eye for five or six months, and had seen the halo about street lights. On examination tension was found increased, vision diminished one-half. Some months later iridectomy was performed, and a solution of escrine (4 grs. to the oz.) instilled every four hours into the other eye. Pain was at once relieved and all symptoms of glaucoma rapidly disappeared. Mrs. M., aged 45, had frequent attacks of neuralgia and noticed defective vision in the left eye six months before coming under observation. Tension was found much increased; she had seen halo about artificial lights for eight or ten months. Distant objects could be clearly perceived by right eye. Iridectomy was pain and preserving the vision of the right eye. The ing the past year, but could not give me a definite restored and left eye much improved.

Dr. E. E. Holmes reported

A CASE OF FOREIGN BODY IN THE ANTERIOR CHAMBER.

was setting a machine punch so the punch would especially in the liver or other internal organs. They accurately fit the die. The power was applied, when must, consequently, be regarded as quite malignant. the punch did not accurately correspond to the die. At the same instant something entered the patient's eye. He came to my house twenty-four hours after the accident with the eye slightly red, but not painanterior chamber, in close contact with the cornea.

cornea did not please me.

Dr. Holmes also reported

A CASE OF INTRA-OCULAR TUMOR.

relief from pain was great, vision of right eye fully expression of their opinion. When he came to me, a few days ago, the comea was perforated and presented a staphylomatous projection of the growth. For a year there has been pain and for the last six months very great pain. The tissues of the orbit This case was of special interest to me on account around the globe were greatly swollen, but not inof the difficult diagnosis and the difficulty attending durated. In enucleating the eye I expected to find the removal of the foreign body. The doubt regard- the sclerotic destroyed posteriorly and the orbital ing the diagnosis arose from the fact that there was tissues invaded. The enucleation, however, was pera small central perforation of the cornea. Below formed as easily as in ordinary cases. The optic this, and not connected with it, was a fine greyish nerve is seen to be enlarged several millimetres beline extending downward and inward (R. eye), ap hind the sclerotic. The swelling in the orbit was parently in the substance of the cornea, fairly into caused by nodules of fat filled with numerous bloodthe angle of the iris and cornea. This resem- vessels. Dr. Ochsner pronounces the tumor to be bled the channels left after the removal of fine a small round-celled sarcoma with very little pigment. slivers of grain stalk which are sometimes thrown The nodules of fat are free from sarcoma cells. They may, however, reappear,

Dr. Boerne Bettman read a paper on the

CONNECTION BETWEEN OCULAR AND NASAL DISEASES.

The author thought that numerous pathological ful. I prescribed atropine and sent him to the hos- conditions of the eyes and lids are attributable to pital. The next morning the pupil was round and abnormal changes in the nose, and that in these cases fully dilated. The media were all clear. I felt great treatment of the ocular organs alone will fail to alleanxiety in regard to the case, but inasmuch as during viate the trouble. After referring to Hack's monofive days there were no symptoms of inflammation graph on the subject, Dr. Bettman detailed several along the supposed track in the cornea, I finally be cases in substantiation of his theory: A boy of 10 came convinced that there was a fine splinter in the applied for treatment of epiphora of both eyes. The eyes were constantly weeping. An examination of I made quite a long incision through the lower, the nose revealed an extensive swelling of the anteborder of the cornea, the knife touching and moving rior portion of both turbinated bones. When these the piece of steel. I endeavored by means of a parts were touched with the probe profuse lachrymafine forceps to seize the lower part of the steel tion was induced, and a light thrown into the eye by and disengage the point from the tissues at the angle means of the ophthalmoscope produced violent sneezof the iris and cornea by carrying the steel farther, ing. A deep incision was made in the swelling with towards the pupil. This was found to be impracti- a knife electrode, and a flat burner was also employed. cable, since the lower end of the piece was firmly. The slough was completely thrown off in fourteen held by the tissues. I used all the violence I consid. days and the boy cured in one month, the eyes reered warrantable. As the anterior chamber was ceiving no treatment. Polypi of the nose have been without aqueous humor, there was some difficulty in found to produce secondary affections of the eye: further procedure without violence to the lens or iris. Hermann S. was prevented from following his trade I consequently extended the wound in the cornea of a cabinetmaker on account of the excessive flow upward so the upper end would correspond with the of tears; he also complained of pain in the eyes. upper end of the steel. This end was easily seized Polypi were removed from the middle turbinated and with considerable force withdrawn. The splin-bone with the Jarvis snare and a cure effected. E. ter was three-sixteenths of an inch in length. Ese. B., aged 16, was extremely sensitive to light and the rine at first, then atropine with antiseptic dressings eyes were both bathed in tears. Each time the eyes were applied with great care. There was no reac- were exposed to a glare of light she sneezed violently. tion, the patient recovering perfect sight, except as There was Hack's swelling in both nostrils. Two far as there was dimness from the central cicatrix in pledgets of eotton were soaked in a 5 per cent, soluthe cornea. Vision was good five weeks after the tion of cocaine and allowed to remain five minutes at patient had returned home. I must confess the al. a time. There was an immediate effect, and in most V-shaped incision in the lower border of the three quarters of an hour she was able to bear the light. The patient refused cauterization and employs cocaine to avert photophobia. The majority of cases coming under Dr. Bettman's observation have been treated by applications of the galvano-cautery to the This tumor, filling the sclerotic, is a sarcoma of the nasal membrane. The appl cations restricted to the choroid. The patient, a man 62 years of age, had, anterior end of the turbinated bone frequently fail to been under the observation of several specialists durigive relief. It has been found that a sensitive area

exists at the posterior end of the inferior turbinated bone and also at the anterior part of the nasal cavity, in the angle forming the boundary of the vestibule. In conclusion, the author thought oculists should always subject the nose to a thorough exammation when seeking the source of ocular complaints.

Dr. H. M. Starkey read a paper entitled

SOME MODIFICATIONS IN THE TREATMENT OF STRIC-TURE OF THE NASAL DUCT.

The author said that about 1883 the Western Suppository Co. made a lachrymal bougie of medicated gelatine of such elasticity that it could easily be passed into the nasal duct. It was less painful than a metal probe, and its slow solubility kept the mucous membrane at the point of stricture distended so that it could be acted upon by the medicine from the use of electrolysis in these cases to be often unthe punctum without slitting the canaliculus, followed by astringent injections over the inflamed surface. This treatment proved entirely satisfactory, and in enucleation, but for the first stage, the premonitory destruction of tissue.

author's method of treatment: Mrs. L. suffered from lachrymation of each eye for two years. There was severe lachrymal conjunctivitis of the right eye, the punctum being contracted one-half. On dilating the right punctum a No. 2 probe could be passed without difficulty, but the whole interior of the nasal duct had to general practioners, the author attached so little the peculiar velvety feeling that is caused by thick villous mucous membrane. The same condition, in less degree, was found on the left side. Treatment was commenced by applying a weak astringent and washing out the lachrymal canals thoroughly each to discover glaucoma. I can recall a number of such day with boric acid lotion, followed by a weak as tringent. Once a week a probe was passed through who had been under the treatment of a physician for the dilated punctum down to the naris, using a larger four or five weeks for malarial fever and dyspepsia, probe each time until No. 7 was reached. The re- which was the beginning of an undoubtedly characsult was satisfactory, and in six weeks the patient teristic and typical attack of glaucoma. But the atreturned home apparently well.

Dr. W. Franklin Coleman read a paper on

SYMPATHETIC OPHTHALMIA.

Disease in the sympathetic eye generally occurs when there has been a wound or operation in the dangerous zone of the diseased eye. Becker, in a certain extent after the attack lost somewhat its 1875, collected twenty two cases of sympathetic severity. Another case: A poor woman lost one ophthalmia from cataract operations, foreign bodies eye from glaucoma ten years before; the eye was lodging in the eye, and degeneration of a lost eye, blind and hard, showing the characteristic state of or other causes. Dr. Coleman read in detail the clin- an eye in which glaucoma had run its course. She ical history of the disease, and enumerated the was attacked by a severe pain in the head extendcauses, histories and results of the treatment of a ing over the left side, could not sleep for several large number of cases. In regard to treatment he weeks, was nauseated, vomited, and showed sympadvised as per the following:

CONDITION DIS- EASED EVE.	CONDITION SYMPA* THETIC EVE.	TREATMENT.

Blindness.	Sympathetic irritation.	Enucleate.
Blindness.	Sympathetic inflammation	Enucleation not often advisable.
More or less vision	Normal.	Do not enucleate generally.
More or less vision	Sympathetic irritation,	Better enucleate.
More or less vision	Sympathetic inflammation	Do not enucleate.
Acute ophthalmitis	Normal,	Never enucleate.
Acute ophthalmitis	Sympathetic irritation.	Puncture and foment dis- eased eye, then enucleate.
Acute ophthalmitis	Sympathetic ophthalmitis.	Treat oplithalmitis, and then enucleate.

Dr. F. C. Horz said: I think the theory of the thirty to sixty minutes. He thought results showed author in regard to the closing of Schlemm's canal and the approximation of the iris to the cornea insatisfactory. The object to be attained is to restore terfering with filtration cannot account for glaucoma. the diseased parts to as nearly a normal condition as Pathological anatomy has so far failed to find the possible, and the most satisfactory treatment is by cause, and we have to rely on clinical studies to build using injections more and probing less frequently. up a theory which will account not for the late stage, The author determined to try the effect of probing the fully developed glancoma, where the sight of the eve has been permanently destroyed by the disease, and which the pathologist gets from the oculist after about five weeks a patient went to his home in an-symptoms before it becomes an acute attack; a stage other State with apparently perfect recovery, and no which the pathologist has not yet investigated with his microscope. At that stage who can say certainly The following case was given as illustrating the what glaucoma is? It is probable that various causes lead to the same result. I believe that the agglutination of the iris to the cornea, the compression of Schlemm's canal or any other part of the eye, are consequences, and not primary causes of glaucoma. I was somewhat surprised that, in a paper addressed importance to the clinical symptoms in glaucoma, of a general character, such as gastric and febrile disturbances in connection with hemicranic headache. These symptoms often cause the practitioner to fail instances. Last October a lady came under my care tending physician's attention was attracted by the coated tongue, the nausea, vomiting, severe headache and excited pulse, and he treated the patient for these daily attacks of headache, which he diagnosticated malaria, and used antiperiodic remedies, utterly disregarding the condition of the eye, although the sight was at first nearly extinguished, and only returned to toms of some general disturbance. The physician

treated her for the stomach trouble and headache, common. In one of these cases I was able to effect and although she told him time and again that her a complete cure by cauterization of the nose. A sight was getting poor, and suggested that an oculist third type of nasal affection giving rise to ocular had better examine her eye, he paid no attention to symptoms is true catarrh of the upper and front part this, and the result was that two months after this of the mucous membrane of the nose, where the attack the sight was entirely gone and could not be membrane is distinctly reddened and where there are restored. In still another case both eyes were neg- generally slight and by no means prominent symplected until the patient could perceive only a little toms of catarrh. In these cases I have very freeyes. Dyspepsia, gastric fever, malaria, and sick made by using delicate probes. Such cases, I can headache were the diagnoses, and the treatment was testify from my own experience, are entirely curable ered in with these general constitutional symptoms, common adenoid vegetations.

Dr. Lyman Ware said: I have only a word to that they are secondary rather than primary.

Bettman presented are of great interest from the fact treatment by means of calomel, atropia, and the custhat they have only lately been recognized. Dr. tomary applications to the eye, proved inefficient, Gruening, of New York, was the first to point out while the addition of nasal treatment hastened the that there existed affections apparently of the eye, cure of some of these tedious cases. The nose was but which in reality originated from the nose. I have probably normal to start with, but the continued flow watched for these cases ever since Gruening's paper of tears produced either small erosions or some little first appeared, and would say that the cases in which catarrhal troubles of the mucous membrane at the the nasal trouble is entirely the cause of eye disease front of the nose, subsequently increased to chronic are not very frequent. But I have seen instances catarrh, leading to congestive obstruction of the tear where affections of the eye were certainly compli passages, or exerting an unfavorable nervous influcated by nasal trouble, and the nasal trouble pro ence upon the eye trouble. Finally, as a rare inlonged the eye disease. I recollect a number of cases stance, I will mention one case which is now cured, of eye disease either kept up or originated by nasal. The patient was sent to me for polypi, which, howtrouble. The first of these is a pseudo erysipelas of ever, proved to be the minor trouble in the nose, the lids, which is not an infectious disease, but merely the real trouble being an immense vascular tumor a secondary affection of the blood-vessels, only re- occupying the entire floor of the right side of the sembling erysipelas clinically. It is entirely due to nose, covering the inferior turbinated bone and reachirritation and engorgement of the blood-vessels in the ing about to the middle turbinated bone. half way between the ciliary body and the entrance to the optic nerve. The operator cut through the the magnet in and brought out the foreign body ap-

SUFFOLK DISTRICT MEDICAL SOCIETY.

Section for Clinical Medicine, Pathology AND HYGIENE.

Stated Meeting, January 13, 1887. Albert N. Blodgett, M.D., Secretary.

The meeting was called to order at 8 o'clock by DR. F. I. KNIGHT, Chairman. On motion, the reading of the records of the last meeting was omitted. The Chairman announced the subject for the present meeting to be a debate upon the danger to the public from

ARSENICAL WALL-PAPERS,

Dr. Chadwick, in response, presented an interesting and vivid account of the occurrence of arsenical,

And if a man wishes to get work he will deceive the sions, and spoke of the uncertainty which exists in very elect as to which is the real and which the arti-relation to the presence of arsenic in wall papers, ficial eye. I cannot see any advantage in not ad-even when the dealer presents the certificate of a vising enucleation where the eye has been injured to chemist as evidence that the papers are free from this dangerous substance. At the close of his re-Dr. Gilmork asked Dr. Holmes why he did not marks, Dr. Chadwick offered the following resolution:

Resolved, That it is the opinion of this meeting Dr. Holmes replied that he had been in so much that the clinical evidence already adduced in this and

The resolution was seconded, and was then de-

described, without injury to the iris or lens.

The Chairman introduced Mr. J. F. Bumstead, the well-known paper dealer, who was invited to address the eye is a delusion and a snare. For instance, if the meeting. Mr. Bumstead responded by saying you introduce a magnet within the eye not knowing that he did not desire to occupy the time of the where the foreign body is before placing the point of members to any great extent. In all large establishyour magnet, you have to search the whole cavity of ments there are many persons employed, and the the eyeball and reduce it to a jelly before you can facts in regard to the purchase of paper by Dr. extract the body. Granted no great harm is done if Chadwick are, that Mr. Bumstead did not personally you do not extract it with the magnet, for you can exhibit the papers, but a salesman in the service of afterwards enucleate the eye. But so far as I have the firm was the person who made the transaction. tried it, and have seen others experiment with the The statement was made to the purchasers that no papers would be shown except such as had been pro-Dr. Holmes replied: That is very true in many nounced by chemists of repute to be free from

It is desirable that the position of the paper and other processes of manufacture of wall-papers, DR. COLBURN said: I recently saw an interesting and the substitution therefor of equally useful, but case in which the foreign body was lodged about harmless methods of treatment, by which the health and lives of the people may not be endangered. Personally, the paper dealers do not place credence sclera about where he thought it was lodged, passed in very many of the alarming reports which are, from time to time, circulated in relation to the ocparently without wounding the retina at the point currence of dangerous interference with health from of attachment. The patient made a good recovery, the action of the colors used in wall papers. It is both a mistake and an injustice to suppose that the dealers do not take pains to have their wares examined in relation to their safety. Messrs. Bumstead & Co. have had four different chemists in their service during the last twelve years. The intention was to exclude dangerous papers from the business. About two or three years ago, an agreement was made between the wall paper manufacturers and the dealers, that the manufacturers should take back all arsenical papers. For some time the manufacturers would not accept any orders from the trade, on account of the great frequency of rejected papers, but lately they again consented to receive all papers returned to them which contain more than a trifling amount, called a trace, of arsenic. A portion of the present disturbance in regard to arsenical papers and called upon J. R. Chadwick to open the dis- arises from the fact, that many of the papers now examined are such as were manufactured some years ago, and some of the papers have been for years on

Another source of error is found in the which the poisonous symptoms might occur with is any considerable amount of arsenic in a suspected fully as much probability as from the paper on the paper? walls, such as the colored fabrics of dress, or the decorations or upholstery.

not infrequently were obliged to suspend their labors. in this way will roughly be about γ_0 of a milligrame. It is difficult to understand the statement made by as arsenic should be without harmful influence.

Dr. G. E. Francis, of Worcester, offered a word of caution in relation to the accuracy of the opinion that all the disturbances so frequently ascribed to arsenic are in reality due to this cause. Before any further appeal is made to the Legislature we should be prepared to meet our opponents in every direction. Let us suppose that a paper which has been The President, Chas. Warrington Earle, M.D., in service for twenty years has at length caused the appearances of arsenical poisoning. The analysis of the paper proves that it contains 2 grains of arsenic to the square yard. Now the question which must be answered is this: How much arsenic has been lost by the paper during the many years of GROUP III. -- FORMS OF INFECTIOUS SALPINGITIS PROservice, if it still contains so large an amount at present? If the paper, after so long a time, still contains a large amount of the poison, then certainly

Dr. Henry Carmichael said that, there is no if the color is absolutely free from any appreciable protection without analysis. No eye can discern amount of the poison. There are two principal where the arsenic is deposited, and no other means questions: First, how much arsenic is really present will adequately detect its presence. There is need in honest and well selected papers? The second of a clearer understanding upon another point, question is: What is the minimum quantity of When we say that a paper is free from arsenic, what arsenic which may induce the symptoms of poisondo we mean? If we mean that the paper does not ing? One undoubted form in which arsenic may be present the indication of minute traces of arsenic, liberated is in the form of arsenuretted-hydrogen, then it has not been my fortune to have discovered from the presence of arsenious acid in contact with any papers free from arsenic. All papers will pre- moulding substances, which evolve the hydrogen sent the traces of small amounts of this substance, gas. In a case in which suicide was committed by under any circumstances. Different vages, complicated with pelveo peritonitis. The tubes rieties of micro-organisms may enter the tubes,

Every physician whose scientific standpoint is the Undoubtedly the microbes of traumatic infection same as mine will admit that matters regarding sala girl of 16, in which an inflammatory disease of the appendages, and to satisfy oneself with the diagnosis right uterine appendages developed, consequent upon of pyosalpinx in case the tubes are found filled with pus; but that it is our duty, employing all the means My reason for again considering these forms of in-furnished by modern science, to endeavor to make fectious salpingitis belonging to Groups I and 11, in an accurate diagnosis of the form of disease affectregard to their occurrence in children, is this: there ing the uterine appendages before the operation, and are evidently other infections of the female genital afterwards to add to our clinical observation careful

pathological and bacteriological examination of the scientists. I advise Mr. Lawson Tait to learn Ger- sion, and with little or no pain. man and to read the works of German gynecologists: he may then perhaps come to the conclusion that there is much which he might profitably study.

Here in Germany, Lawson Tait is held in high esteem, as he deserves to be, on account of his brilliant practical results. We have long since, however, ceased to regard as serious his theoretical utterances, which pretend to be scientific. The tone which he adopts in his polemic writings does not prevail with us in Germany, and it is certainly looked upon as undignified by every gentlemanly Englishman. I am, sir, etc., Dr. M. Saenger,

Privatdocent at the University of Leipsic, President of the Obstetrical Society of Leipsic.

Dr. Edward B. Weston, on presentation of a thesis entitled

METRITIS,

read by the Secretary, was elected Fellow of the Society.

DOMESTIC CORRESPONDENCE

ONE OF THE "ITINERANT SYSTEMS" OF RECTAL SURGERY.

Dear Sir:—In a recent number of The Journal. I described the amusing instrumental outfit of the itinerant practitioners upon piles, fistulæ, and fissures. The following is a condensed statement of the oldest of these secret "systems" so far as it relates to rectal ulcers. The information is from a trustworthy NINTH INTERNATIONAL MEDICAL CONCRESS. source, but I am not at liberty to use the name at present:

Once or twice a month, as the itinerant comes around on his circuit, he inserts his little speculum, cleans out the ulcer, and applies to it a solution of nitrate of silver, 40 grains to the ounce. Between the applications, the patient uses a morning and evening treatment himself. Each morning he is to evacuate the bowels, then inject the rectum with lukewarm water, and finally insert into it a little ointment consisting of 3 grains of carbolic acid and 8 grains of sulphur to the ounce of vaseline or lard.

For evening treatment he uses "Brinkerhoff's Ulcer Remedy," having the following composition:

R.	Extract of hamamelis (distilled)		
	Solution of persulphate of iron	" 5j.	
	Cryst, carbolic acid	grs. ij.	
	Glycerine	fl. 3 ij.	m.

Add half a teaspoonful of this to the same quantity of starch. and about an ounce and a half of water. Inject into the rectum every evening.

This energetic use of nitrate of silver will of itself specimen. This certainly is a higher standpoint than often cure a fissure, as has long been well known to that occupied by Lawson Tait, to whom the removal us. I find, however, that if the ulcer is situated of the uterine appendages is the chief thing, and upon the sensitive verge of the anus, as it usually is, who, neither before nor after the operation, concerns the application is atrociously painful, causing sufferhimself with the nature of the disease treated. He ingequal to that of an incision. I am now experiadmits, himself, that in every fifth case he made an menting upon the plan of daily unfolding the fissure, error in diagnosis. In a man like Lawson Tait, so washing it out with mild antiseptics, and then packgreat in his own estimation, it seems rather small to ing it with dry iodol. I am not prepared yet to state attempt to conceal his ignorance by resorting to in- final conclusions, but there is reason to think that sulting and scurrilous remarks in regard to German many fissures may be cured in this way without inci-

COCAINE IN URETHRAL CARUNCLE.

Dear Sir:—In the British Medical Journal of January 1, 1887, is a query regarding the use of cocaine in urethral caruncle, as to strength of solution, pain during and after operation, and whether the caruncle is removed by excision or cautery.

In August, 1886, I was called to see Miss W., :et. 16, who had been lying helpless for one month with a urethral carnicle. She was lying on her back with the legs crossed, and unable to move on account of the pain. I applied a 5 per cent. solution of cocaine on absorbent cotton, and having no scissors with me, I trimmed a small twig flat, pushed it up under the caruncle to steady it, and removed the growth with one sweep of my pen-knife. The cocaine acted within five minutes, rendering the caruncle painless, and before I left the house the patient was out of bed and walking about the house. There was no pain during or after the operation, and the hæmorrhage was inconsiderable. Very truly yours,

J. D. Eggleston, M.D.

Worsham, Va., February 1, 1887.

INTERNATIONAL CONGRESS.

Section IV--Obstetrics.

The attention of gentlemen who desire to contribnte papers to the Section of Obstetrics, is respectfully invited to the following extracts from the Rules of the Preliminary Organization:

"Brief abstracts of Papers to be read in the Sections shall be forwarded to the Secretaries of the proper Section on or before April 30, 1887. These abstracts shall be treated as confidential communications, and shall not be published before the meeting of the Congress. Papers relating to topics not included in the list of subjects proposed by the officers of the Sections, may be accepted after April 30, 1887, and any member wishing to introduce a topic not on the regular lists of subjects for discussion. shall give notice of the same to the Secretary General, at least twenty-one days before the opening of the Congress. The titular officers of each Section shall decide as to the acceptance of such proposed communications, and the time for their presentation.

No communication shall be received which has already been published or read before a Society.

"The official languages of the Congress shall be than April 30, 1887. English, French and German. Each paper or ad dress shall be printed in the 'Transactions' in the title, and to be accompanied with a sealed letter conlanguage in which it was presented. Preliminary abstracts of papers and addresses shall also be printed author. These letters not to be opened until after in the language in which each is to be delivered. All the award is decided. discussions shall be printed in English.

special business of any Section, must be addressed to nual report, one hundred copies to be given the the President or one of the Secretaries of that Sec-; author. tion. As many details of the Congress and numerous appointments of officers are yet to be completed, other circulars will be issued from time to time, as circumstances may demand."

The meetings of the Section of Obstetrics will be held in Washington, D. C., on the afternoons of September 5, 6, 7, 8, 9 and 10, 1887.

MISCELLANEOUS.

New Foreign Journals.—Revista de Medicina e Chirurgia is the title of a new monthly journal published in Oporto, 56 Rua de Libertade, the first number of which appeared in January.

Therapeutische Monatshefte is the title of a new monthly journal published in Berlin, and edited by Professor Oscar Liebreich, A. Laugaard, and S. Rabow. The first number appeared in January.

Annales de l'Institut Pasteur.-M. G. Masson, 120, Boulevard St-Germain, announces the journal of this name, soon to appear, to be published monthly, under the editorship of M. Duclaux, with the assistance of MM. Graucher, Chamberland, Nocard, Roux, and Straus.

A PRIZE ESSAY ON HAY FEVER.—At its last meeting, September, 1886, at Bethlehem, N. H., the U. S. Hay Fever Association decided to offer a prize for the best essay from a competent source, preferably a physician, on some question relating to *Estivis*, or Hay Fever. The amount is necessarily small; but as the accepted essay will be published in the Association's report, when the extent of its circulation. and the character of those whom it will reach, shall be considered, it is thought that the successful trea tise will give to its author a reputation worth the effort.

In order to carry out the above the following is announced officially:

1. Subject of the essay, Hay Fever. (a) Its pathology. (b) The predisposing, and the aggravating causes. (c) Advice to the sufferer.

2. The essay not to exceed four thousand words, and to be as practical and non-technical as possible.

3. The manuscripts to be received at the office of Samuel Lockwood, Freehold, New Jersey, not later

4. Each manuscript to have a motto under the taining said motto, also the name and address of the

5. The prize to be \$25. The accepted essay to "All communications and questions relating to the be published immediately in the Association's an-

There are headaches with cer- apparently has cured the headache. tain definite characteristics which are caused not only by hypermetropia, but also by its different de- these different forms of ametropia manifest themgrees, as there are of myopia and its different deserves in all the various forms of headache. In a grees. These fixed peculiarities are still more marked, comparatively recent, and voluminous work on the in the different forms of astigmatism. The severity "Nature and Cause of Headache," by Wm. Henry of the pain seems in some measure to depend upon. Day, of London, a lengthy chapter is devoted to the the nature of the ametropia, ranging from the dull, consideration of the headaches of youth. He deheavy ache in and around the eye found in the lighter plores the popular methods of education which push degrees of hypermetropia and myopia, through the a child forward in the acquisition of knowledge withseverer forms found in the higher degrees of these refractive errors, and in simple and compound astigmatism, to the intense neuralgic pain of that rare form of defective called mixed astigmatism. This latter pain may be of such severity and of so frequent occurrence as to destroy the usefulness of the life of undermined and life is absolutely shortened." the individual.

ary last, and, although somewhat of a digression, I and how, with the school boy and girl, all too freshall take the liberty of presenting it. This patient quently the eye is the link which first gives way, it healthy and strong. Her only complaint was about in no instance mention ametropia as a possible cause. her "terrible head trouble." She had been troubled not alone of the severe headaches of childhood, but if the sun shone brightly, she could not read her less health. sons, and would have to press and squeeze her eyes | There is, however, one form of ametropia to which, in order to see at all. About seven years ago her on this occasion, I wish especially to refer, and which eyes were in such a condition that she could not look is exceedingly common among our school children, at any bright object, or use them for any ordinary. It is of slight degree and therefore easily overlooked. work for months at a time. Since she was 15 years | Indeed, it may simulate some of the less severe forms

gravity 1.028. Albumen, none. Sugar, none. Mi of age she has had terrible headaches in the forehead croscopic examination found one granular tube cast, and temples, and in and around the eyes. As she from straight uriniferous tubules, also a few epithelia stated, the pain is so intense it almost drives her mad. from pelvis of kidney, some epithelium from bladder. She can not even ride in a street car for fear the "neuralgia," as she termed it, would start up again.

These severe headaches were accompanied at her "bilious attacks." At other times her "eye headache" came, when the pain seemed to be in and at the back of the eye, and which pressure relieved. At still other times the pain was located at the base of the nose, and these she called her "catarrhal headaches." In all, however, the pain in the eyes was severe. For fifteen years she has had these severe attacks regularly twice a week. They last sometimes a day and a night, and sometimes two days and two The subject of my paper is rather the relation of cer- nights. She has taken medicine for biliousness and for lung and liver and stomach and throat troubles. The headaches arising from defective vision are so and now, as a last resort, she comes to see if her numerous, and show such definite characteristics in eyes can be in any measure the cause of her suffering. connection, not only with the different forms of ame. On examination 1 found vision very defective, being tropia, but with its different degrees, that the oph-tbut $\frac{1}{10}$ in the left eye and $\frac{1}{10}$ in the right. Plus and thalmologist might easily furnish a terminology of his minus glasses were refused. The ophthalmoscope own. Instead of the usual classification into sympas showed the usual distorted appearance of the disc thetic, neuralgic, antemic, hyperæmic, etc., another seen in astigmatic cases, with a moderate degree of division, based solely upon the condition of the eye, myopia in the vertical meridian, and of hypermetromight be made. This might be done, too, without pia in the horizontal of both eyes. An aperture was left posteriorly for the insertion of a drainage-tube; a plaster of Paris bandage was applied, extending from the toes to above the knee, They conclude that no one should be deterred and the foot was placed in a corrected position; the

> The size of the V-shaped interval left after the reallow the anterior portion of the foot to be placed in a proper position without any tension on the tissues on its inner aspect. I think that a subcutaneous division of the ligaments on the inner border of the foot, when they are tense, would facilitate the cor-

> The dressings should be as light as possible, not

The advantages maintained for this operation over tarsal joint are:

- 1. It is anatomically and mechanically correct.
- 2. A smaller amount of hone has to be removed,
- 3. No joint is opened, and, consequently, the foot is left in a more normal condition.
- 4. It does not practically shorten the foot in front

The class of cases suitable for this operation are:

1. Those of patients who have reached the age of

5 or 6 years with the deformity unrelieved, who have the profession in the usual routine manner, must be walked on their feet, and in whom the parts are rigid absolutely discountenanced. and the deformity marked.

position after years of careful treatment.

these patients the removal of a small wedge from centres, especially on the musculo-motor centre of that bone would accompany the result.—.V. Y. the heart, alcoholics are mainly indicated in padi-Medical Journal, Ian. 15, 1887.

JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION, No. 65 RANDOLPH STREET,

CHICAGO, ILLINOIS.

SATURDAY, FEBRUARY 26, 1887.

THE ARMY AND NAVY REPORTS.

The Reports of the Surgeon General of the Army and the Surgeon-General of the Navy for the fiscal occurred in soldiers under 26 years of age, or 4.14 year ending June 30, 1886, have just come to hand. per 1,000; and there were 41 cases between the ages The Army Report is a rather miserable looking little of 26 and 41, or 2.86 per 1,000. Of the 32 cases of pamphlet, without an index, while the Navy Report, diphtheria 25 occurred at Ft. Assiniboine, Mont., though but little larger, is at least substantially and at tractively bound, and has an index.

exceptional freedom from disease, the actual number impossible. of admissions to sick report being 3,839 less than for in determining liability to sickness among the troops: rate of occurrence for diarrheal diseases, for typhothe tables show that even in this year of exceptional malarial fever, and for the malarial fevers." In reimmunity from sickness in the Army, a greater pro-gard to the health of troops by military departments portion of sick was furnished by troops under thirty. it is seen that the Department of Texas stands first one years of age; "while up to the age of twenty five on the list, with a rate of 1,641 per 1,000 of strength, the rate proved so much above the mean for the and a constant rate of 55 per 1,000; being higher whole that it may fairly be questioned whether the than for the previous year. The troops in this Deservices rendered by these young men are equal to partment seem to show a special liability to malarial, the cost of their maintenance."

vice, and up to the fifteenth year, afford less than science, it may be seen from a table that the one-half the number of admissions to strength for Department of the East shows a rate of admisphthisis to those of any less service; but beyond fif sion for malaria to 1,000 of strength of 123.9, as teen years the rate seems to increase. Two years against 33 3 for the Department of Dakota 46.2 for ago malarial fevers occupied the fourth place on the the Department of the Platte, and 24.6 for the Delist of diseases, but it is now lowered to fifth place, partment of California; and that while the South

the number of cases per 1,000 of strength having fallen from 147 to 120 per 1,000, and the rate of mortality .14 per cent. of the cases treated, against .17 per cent. for 1884, and .15 per cent. for the decade. This lowering seems to have been uniform, for no single month has shown any great departure from the normal. Of the 139 military stations from which reports were received 36 showed a higher rate than 120 cases per 1,000, Fort Gibson and Fort Sill, Ind. P., heading the list with 1,287 and 753 cases per 1,000. Considering the dreadfully unsanitary condition of some of the posts it seems a little remarkable that only 76 cases of enteric fever, or 3 per 1,000 of mean strength, occurred during the last year. The number of deaths was about 12 per cent, of the cases treated. During the previous year there were 156 cases, and 222 in 1883. The number of stations at which the disease continued as a result of the infection of the previous year was 19; the number of posts newly invaded was 17; and at 20 posts it ceased to exist. Of the 83 cases of acute articular rheumatism 35 with no deaths. The medical officer in charge, Dr. Henry G. Burton, reported that the task of ventilat-The Army report shows that the last was a year of ing the barracks during the winter months was almost

INTERNATIONAL MEDICAL CONGRESS-TRANS-ATLANTIC RATES.

In The Journal for the 5th inst, we published an official notice from the Chairman of the Committee of Arrangements at Washington, saying that reliable arrangements had been made by which members wishing to attend the International Medical Congress in Washington September 5, 1887, can be accommodated by the following steamship lines at the liberally reduced rates mentioned, viz.:

Red Star Line-\$100, Antwerp-New York and return.

Inman Line - \$100, Liverpool-New York and

Hamburg Line — \$90, Hamburg-New York and

Royal Netherland—\$80, Amsterdam-New York and return.

Since that notice we have received authentic information that the several lines named have consented to extend the same rates to the families of members, as the following letter shows:

WASHINGTON, D. C., FEB. 14, 1887. A. Y. P. GARNETT, M. D., Chairman of the Committee of Arrangements of the International Medical Congress:

Dear Dector: I am happy to inform you that, through the

instrumentality of Mr. Edward F. Droop, agent in this city for the Lines, who has manifested so much interest in this matter, we have been able to secure from the Hamburg-American, the Red Star and the Inman Lines the offer of the same reductions for the families of members of the Congress as those I have already reported for the members, themselves. Very truly yours, J. W. H. Lovejoy,

Chairman Com, on Transportation.

To aid the work of the Committee on Transportation, the State Department of our Government at Washington has kindly instructed the resident U.S. Consuls at European ports from which the steamships leave, to actively aid in ascertaining the number of those wishing to avail themselves of the reduced rates offered. This is more fully explained by the two following letters:

FEB. 14, 1887.

Edit. If the Journal of the American Medical Association: Dear Sir :- The following additional information relative to transatlantic transportation is furnished for publication:

The White Star Line, as well as the Cunard Line, having declined to make any reduction in fare, you will please strike out Harve from the list of European ports last published.

I enclose also, for publication, a copy of instructions which the State Department has kindly sent the resident U.S. Consuls at the ports of Liverpool, Hamburg, Bremen and Antwerp. Very A. Y. P. GARNETT, M.D.,

Medical Congress.

DIFT. OF STATE, WASHINGTON, FEB. 5, 1887.

Str := The Committee of Arrangements of the International Medical Corgress, which meets in Washington in September next, desire to ascertain as nearly as possible the number of delegates who will attend the same, with a view of making favorable terms for their transportation. For this purpose you are there are instructed to bring the matters to the attention of those interested by such means as you deem best, requesting that you may be furnished with the names of such delegates as will attend and the number of ladies who will accompany them. The result of your efforts should be promptly reported. I am, sir, your obedient servant. 1. D. PORTER,

Ass't. Secretary.

It will be a great favor to all parties interested in ent countries of Europe will give the foregoing information to their readers as early as practicable.

AN LYCHLENT EXAMPLE.—The Allegheny County Medical Society, of Pennsylvania, has unanimously voted an appropriation of one hundred dollars towards the expenses of the International Medical Congress. There are many more County and local Medical Societies, embracing a large membership, that could do the same with great propriety, and with out incurring the slightest financial embarrassment.

SOCIETY PROCEEDINGS.

ST. LOUIS MEDICAL SOCIETY.

Stated Meeting, January 15, 1887.

THE PRESIDENT, S. POLLAK, M.D., IN THE CHAIR.

Frank R. Fry, M.D., Secretary.

Dr. Frank R. Fry read a paper on ELECTRICAL DOSAGE.

The question is frequently asked now a days by those who are becoming more interested in electrotherapeutics, but who have not especially studied the subject—can we tell the dose of electricity? Can we form a schedule of approximate doses for the various ailments in which we know this agent to have remedial effects? At the last meeting of the American Medical Association in this city Dr. Franklin H. Martin, of Chicago, read a paper on "Electrolysis in Gynecology." In the discussion of this paper Dr. George F. Hulbert, Superintendent of the St. Louis Female Hospital, is reported in the JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION to have said: "As well use strychnine and quinine without measuring the dose as to use electricity without measuring it with the galvanometer." From this we might infer that the doctor means to say that we can measure the dose of electricity with the galvanometer. Chairman Committee of Arrangements for the International In the same discussion, Dr. Geo. J. Engelmann, of St. Louis, in speaking of his methods of operating on fibroid tumors of the uterus by electrolysis, is credited with the following statements: "I know pre cisely the remedy administered." "The galvanic current must be dosed as we dose other remedies." The inference certainly is that there is a precise means of measuring the dose, and that it is employed by Dr. Engelmann in his work with electricity. Similar statements have been made by other gentlemen elsewhere.

The object of this paper is to attempt to controvert these statements, and, in a general way, the erroneous opinions that obtain about our ability to scientifically or accurately gauge the dose of electricity. It is not my purpose to discuss the results of the therapeutic use of this agent. In regard to the Congress if the medical periodicals in the differ, the two gentlemen whose names I have taken the liberty to use, it is not necessary for me to say that they are to be congratulated on the results they have obtained, and commended for the amount of careful work they have done in this direction.

In the use of faradic and static machines in medicine, it is at least questionable whether we get directly anything more than mechanical effects. At any rate, we have no data that are available for estimating other effects than these. Hence, in speaking of dosage, we are limited to the galvanic current. In attempting to estimate the dose of this, these items are recessarily taken into account, viz.: the strength of the current, or the quantity passing, its density, and the length of time that it is allowed to pass. shall consider these items as nearly separately as possible.

few unfortunate old fogies who still eschew the clin-48 cm. would give the fraction (8.48=) 16, indicatical thermometer. But he is not sure that my figure ing that one milliampère is spread on 6 sq. cm. of is the patient's temperature. If for some reason he the electrode. Hence, with a galvanometer and wants to know it exactly, and is very confident of electrodes of known area, we can express matheing the instrument, a good galvanometer is of much know the density on the electrode and the area of practical use in our every day work with the battery; the transverse section of the portion of the body inand, as a means of enabling us to express the results cluded in the circuit, we may approach an estimaof our work to the scientific world, it is now indistion of the density of the current in the same, mathpensable.

contact with the skin, I see that the galvanometer the resistance of the body in health and disease. shows a current strength of thirty milliampères. My This point is being now studied by prominent elecone; when I complete the circuit, the galvanometer gations would seem to indicate that there will be netient feels a tingling in the skin under the small elec- electrotonus, polarization and other phenomena controde. Although there is a less quantity, the density nected with the application of electricity to animal is greater. By substituting the small for the large organisms. I mention these facts as merely suggeselectrode, I have increased the external resistance, tive of the magnitude, as well as the unsettled con-

Quantity.—The Electrical Congress of 1881 adopt- If I want to get the same quantity as with the large ed a nomenclature which is being gradually appro-priated by the scientific world. Ampère is the word thus selected to express the unit of quantity. It This I do by switching in more cells, and, of course, indicates the current carried in one second of time in so doing I still further increase the density. We by an electromotive force of one volt through a re-know that with a given quantity, the density in the sistance of one ohm. Most of the recent and best various parts of the circuit will be inversely proporgalvanometers are graduated in milliampères. With tionate to the transverse section of the conductor. a good instrument, we are able to know and express. Therefore, if we know the square surface of the elecin a universally intelligible manner, the quantity of trode and the quantity of electricity in the circuit, electricity passing through a patient at any given we may estimate the density on the electrode. For time. Unfortunately there is not a uniformity in the example, if the galvanometer shows a strength of 8 construction of these instruments. In fact there is milliampères, and the electrode is 8×6 cm. (=48 no standard galvanometer, and we have no absolute sq. cm.), I know that I have a current of 8 milliam. measure of this kind. But we can approach one peres spread on a surface of 48 sq. cm. It has nearly enough for all therapeutical purposes. This been ingeniously recommended to express this relapoint I may illustrate by comparing the use of gal-tion in the form of a simple fraction, for the numeravanometers to that of clinical thermometers. If 1 tor of which we write the number of milhampères, tell a fellow practitioner that I have a patient whose and for the denominator the surface of the electrode temperature is 104° F., my language is perfectly in- in square centimeters. Using the figures just emtelligible to him, unless, perchance, he be one of the ployed to illustrate, 8 milliampères on a surface of the correctness of his own instrument, he will try matically the density on the electrode. With this that. Even then he is not sure, and can only be so fact in view, the advantage of employing electrodes by comparing his to a standard thermometer. For of known, definite areas is apparent; as is also the ordinary purposes, however, the better class of clin-convenience of standard or normal sizes, by means ical thermometers are accurate enough. The better of which we may more readily and intelligibly exkinds of galvanometers do not correspond as nearly press our methods of applying electricity. But we in their readings as do thermometers; also they are must remember that we cannot thus determine the very much more liable to become defective. But density in the body, or portion of the body, through with due care in selecting and occasionally examin- which the current passes. Roughly speaking, if we ematically. If the sectional area of such a part be Density.—With the galvanometer we cannot meas 300 sq. cm., and the surface of the electrode 1 sq. use the dose. It takes no account of density, quite cm., the density of the body will be 1-300 of what it as important an item as quantity, practically more is on the electrode. For obvious reasons this is a so. It is a fact, experimentally proved, that a cur-very unprecise calculation. The current tends to rent must be of a certain density before any appre- travel in straight lines, but also to spread on the ciable physiological effects are produced. Hence conductor. This is conveniently represented in the we may expect practical therapeutical effects only shape of a diagram (illustrated). The density is much from currents of considerable density. Practically greater, as the lines show, near the electrodes, dewe estimate the density from the area of the electreasing as we depart from them. It is also greater trodes. To illustrate, if I take two very large elec- in a direct line between the electrodes. These diftrodes, good conductors, with covers well moistened ferences of density we cannot estimate accurately. with salt water, pass a current with them in firm Before we can we must know more than we do about patient is not conscious of a current. Now I sub-tricians, with more promise of satisfactory results stitute for one of the large electrodes a much smaller than ever before. The showings of recent investishows a strength of but 15 milliampères. The passessity for radical changes in the current theories of dition of the problem of the resistance of the human of dosage is evident.

¹ The coulomb is the unit of quantity, ampère is the unit of current, body. Yet its importance as an item in the matter and equals a current of one coulomb per second, and is as defined above. See discussion of paper.

the conditions requiring their exhibition or the size cases I am my own galvanometer." of doses. In this respect electricity conforms to the. The first of these gentlemen has been, by his own majority of remedies. Data do not exist from which admission, negligent in this matter. The others are we may construct scientific formulæ to guide us in mistaken. The source of their mistake is, I believe, making the dose for use in any of the various ways in their failure to appreciate for what purposes the that we know empirically to be beneficial. Espe- galvanometer is to be clinically used, and the advancially is this true when we are seeking to get its phy-tages to be thus gained. The necessary admission of them should. I always use a galvanometer when I use the conbe a stimulus to greater endeavor in attaining to stant current, for the purpose of knowing at each methods less liable to error. In this spirit, all who and every application how much current is passing are sufficiently informed on the subject, will remark through the patient's body; in other words, what curwith much satisfaction the increased manufacture of rent strength I am using." This is the reply to the galvanometers available for clinical purposes, and readers' questions received from the chairman of the the correspondingly increasing tendency to employ committee on electrical dosage that reported at the these instruments, as well as electrodes of graduated last meeting of the American Neurological Associasizes. An accuracy in the application of electricity tion (St. Louis Courier of Medicine, October, 1886, is attainable with them that without them is impossi-page 325). ble. There is, however, much room for improvement. It will probably be some time before these more accurate means are as universally employed as they should be. As evidence of this, I offer the following: Recently I have written to a number of prominent neurologists who make a more or less extensive use of electricity in their practice. I asked each of them (1) how constartly he used a galvanometer, and (2) for what purpose or purposes some of them as follows:

D₁, —, Cincinnati: "I always use a galvan ometer with my large office battery. It is one I procured a number of years ago in London; but, for half of it could be felt through the tissues. some reason. I do not understand, it has lost its delicacy, and is no reliable guide in diagnosis and therapy. The most valuable galvanometers have been constructed in the last two years, but I have neglect-

Length of Seance.—Regarding the length of time —, Chicago: "I do not use a galvanometer conthat the current is allowed to pass, little need be said stantly. strong currents he had often seen neuralgias, sciatica, PHILADELPHIA COUNTY MEDICAL SOCIETY. for instance, benefited. The current was often strong enough to blister some. He considered the good results in these cases very largely due to the physical The President, J. Solis-Cohen, M.D., in the current, producing physiological effects that helped also. He thought that Dr. Dean and he agreed. The density on the skin is estimated by the size of the electrode. This, of course, can only be done when we know the quantity, which is shown to us by the galvanometer, it being an essential means of estimating density as well as the size of the electrode.

nicalities as possible.

increased resistance was when a small was substituted for a large electrode, he said to a slight extent! in the smaller electrode, but principally in the skin. We use large electrodes to overcome the resistance of the skin. Professor Stone, an English experimenter, believed this resistance could be reduced to nil by using very large lead electrodes, moistened repair should be attempted. I should like to enter with salt water.

density in the same sense as potential? Dr. Fry repotential referred to the electric level.

electricity physiologically.

tial is a difference in electrical level. Back of that ing ball wounds of the abdomen recover. is the electro-motive force at work within the cell that creates and keeps up the difference of potential. Work does not include the element of time. Power not secure a post-mortem, that peritonitis is not the includes the work and time or rate. The term "tension" is dropped for potential. The term strength (of current) is supplanting the term "intensity" (of current), which is a bad imitation or translation of ited blood one hour and a half after admission, althe French *intensite*, which, in electricity as in music, means strength.

Dr. Lee mentioned the fact that bichromate of soda was much better than bichromate of potash for use in making battery-fluid.

Stated Mecting, January 26, 1887.

Dr. Thomas S. G. Morton read a paper on ABDOMINAL SECTION FOR TRAUMATISM, WITH RE-PORTS OF FIVE CASES.

(See page 225).

Dr. Charles B. Nancrede said: I understood Last Saturday evening Dr. Dean had called atten- Dr. Morton to say, that the case of suture of the intion to a technical inaccuracy in the paper, in that testines for ball wound which he reported was the the ampère is said to be the unit of quantity. The first so treated in Philadelphia. He is mistaken, for coulomb is the unit of quantity. An ampère is a I operated on a case of gunshot wound of the abcurrent of one coulomb per second. The ampère, domen some seven months ago, and reported it to therefore, includes the coulomb. Both of these units the Academy of Surgery three months ago. I should were embraced in the old term Weber, which is now like to compliment the Doctor on the immense going out of use. The error had been made inad. amount of labor evidenced by his paper. I think vertently in trying to use language as free from tech- this is a timely subject for discussion. Some three months ago I had the privilege of taking part, by In reply to Dr. Dean's question as to where the special invitation, in a discussion on gunshot wounds of the small intestine, which took place in New York; and was participated in by most of those who had operated up to that time. The conclusion arrived at was that all penetrating ball wounds of the abdominal cavity demand at least an exploratory operation, and if any wound of a viscus be found its a protest against the evident tendency to advise the To a question by Dr. Hurlbert, if he used the term opening the abdominal cavity by any practitioner in every ball wound. Where a large tumor has been plied in the negative, and showed by a diagram that removed the abdominal walls are lax, and there is plenty of room for manipulation. In laparotomy for Dr. HULBERT thought Dr. Fry had demonstrated gunshot wounds or other injuries, the difficulties are that it is a necessity that we use the galvanometer in ten-fold. You have to operate through a tight and the accurate application of electricity. He undernarrow opening. In prolonged operations there is stood the term potential to mean the power the curboften difficulty from distention of the intestines. rent has of accomplishing a certain work; the power. The difficulties in finding the wound are sometimes of overcoming resistance. This term conveniently exceedingly great, so much so that if I had a ball conveys to our minds a clearer idea of the effects of wound in the abdominal cavity, unless 1 could be operated on by one who was in the habit of doing DR. DEAN: Potential represents the degree to abdominal operations, I should rather trust to the which a body is electrified. A difference of poten, old let alone plan. I have seen undoubted penetrat-

> Let me say a few words about my own case which, I think, shows the important point, although I could only thing we should dread. I saw the boy six hours after he had been shot. The wound was a little to the left and above the umbilious. He vomthough the operation showed that both the anterior and posterior walls of the stomach had been perforated. I determined that the wound was a penetrating one and made an incision in the median line; and I would warn any against enlarging the existing wound, if not in the median line. I found a wound of the anterior wall of the stomach which I closed with fine silk, using a fine sewing needle. Then I found a wound in the anterior wall of the duodenum which I sutured. I next looked for and found a wound of the posterior wall of the stomach. A

If we save 30 per cent., perhaps fifteen of these will be murder cases, and on ignorance, and by lowering honesty and intelligence the life of each of these patients would depend that to the same grade with dishonesty and ignorance, of another person, so that we should really save thereby tending to discourage young men from forty-five lives.

STATE MEDICINE.

MEDICAL LEGISLATION IN ARKANSAS. Resolutions of the Izard County Medical Society.

We have carefully examined the existing Law to purports to protect the medical profession and the unwise law. general public from incompetent physicians, and una total failure in our opinion for the following reasons:

First. The law directs that all persons who have years previous to the passage of the law, be allowed to continue in the practice, provided their names be registered in the clerk's office in their respective counties. By this means all incompetent practitinue under the protection of the laws of the State. therefore, Be it Reselved,

Second. The law provides that the County Judge license to any applicant. The County Judge was, in some instances, incompetent to appoint a board grand and a noble cause. intelligibly; and in some instances these officials frequently make the paltry fee, than merit, the requisite qualifications for license.

Third. The law requires that all persons who than five years go before the board of his own (or some other) county, and submit to an examination, allowed to register his name as competent to practice, from the numerous ignorant pretenders who are now medicine. Here the law is unfair and unjust; it compels the *intelligent* and *conscientious* physician to examined by an incompetent and ignorant Examining Board; it compels young men who have spent to any physician's qualification. their time and money to qualify themselves for inthat the most ignorant must undergo.

Fourth. There are instances in which persons who cludes the first cases operated upon, and I think that could not get license to practice medicine in their the next three years will show a great change in the ∂un counties have gone to other counties and obmortality. It will probably get to and remain at tained license, and returned to their own counties to about 50 per cent. Many of these operations were practice medicine. By this means we know of no performed without the knowledge of abdominal failures to get license, even by the most ignorant

Fifth. The law instead of elevating the standard of intelligence and honesty in the medical profession, Most of these cases of traumatism involve the has a direct tendency as far as legislation can effect it, to lower its standard by legalizing quackery and properly qualifying themselves, and inviting ignorant practitioners and unscrupulous quacks into our State from surrounding States, which have passed sensible laws to prevent that class from practicing within their borders.

Sixth. The general public, confiding in the intelligence and honesty of our Legislators, and knowing no criterion but experience, have in a great measure Regulate the Practice of Medicine and Surgery in the learned an expensive lesson, for it is the public which State of Arkansas; and, inasmuch as it ostensibly has received the principal evil results of this most

Now, Whereas, we believe the above statements scrupulous charlatans and quacks, we desire to say, are facts—that the present law encourages and prowith due respect to the makers of the law, that it is tects ignorance and quackery; that it invites the incompetent class of medical practitioners from other States; that it discourages our own young men; that been in the practice of medicine for a period of five it elevates ignorance and degrades intelligence to a common level, as far as lies within the reach of legislation to accomplish it; that it is deceptive to a confiding public; that it is, useless, unjust, and an insult to a conscientious and intelligent medical protioners of five years' standing were allowed to confession, and to an intelligent and confiding jublic;

First. That the medical profession is ancient, of each county appoint a board of three physicians time-honored, coeval with civilization, and has ever in his county, which shall constitute an Examining been an essential factor in every advance made in Board for all who might apply for license to practice the development of science and in the promotion of medicine; and, which shall, at its option, grant human happiness; and that those who are worthy members of the medical profession are engaged in a

Second. That as the medical profession has for its selected their boards through favoritism rather than object the health, well being and happiness of the from merit. In this way incompetent boards have human race; it needs no legal protection to perpetubeen appointed. These incompetent boards more ate its existence or to promote its progress, but it is the public which is imposed upon by quackery, that needs legal protection.

Third. That we esteem the existing law a farce, a have been in the practice of medicine for a less time a fraud, and as unworthy a place on the Statutes of the great State of Arkansas, and we recommend that our next Legislature repeal it; and if it must have a and pay said board a fee of six dollars before being law, that it enact one that will protect the public resting under the protection of the present law.

Fourth. That we will not serve on the County submit to the indignity in some instances of being Board, nor will we accept a certificate from any County Board as sufficient evidence or authority as

Fifth. That we respectfully submit these resolutelligent physicians to submit to the same ordeals tions to the medical profession of the State of Arkansas, and ask it to give them its careful considthe State to join us in presenting these resolutions to admirably engineered, namely in respect of its roadthe next Legislature.

No altered laws will compensate for defective knowledge or will power in the regulation of human affairs. Two leading theories have been advanced to reorganize society, socialism and communism. As Legislators cannot prevent the unerring economic law due to fundamental differences in men's moral and intellectual development. Modern civilization is adapted to make the sharp sharper and the dull duller, or, in other words, conduces to condensation of wealth and diffusion of poverty. All artificial adjustments only complicate existing troubles in leaving untouched the real causes of the troubles. The lazy and criminal classes are the inevitable product of our complex civilization. They are developed by laws which it is the duty of good people to find out and obviate. It is the business of government to prevent or mitigate any environment that all experience shows will pro-

Dr. Chapin spoke particularly of the tenementhouse system and its evils, and after the paper had been discussed by Drs. Spitzka, Janes, and Stephen Smith, Bishop Huntington, Mr. Charles F. Wingate, the sanitary engineer, and others, a resolution was adopted requesting the Academy of Medicine to use before the State Legislature enforcing the registration of tenement house owners at the Health Department,

1. With reference to the parts which the turbinated attributes the discovery to Wilhelm Hack, and in-The report contains a diagram which gives in veighs against specialists because they do not give graphic form a digest of the 48,509 consecutive eye him the credit. The fact is, that the attention of the cases treated in the institution. In this it is noticed profession was first directed to this matter by a paper that the first two columns are much larger than any read before the American Laryngological Association in May, 1881, by Dr. William H. Daly, of Pittsburg.

Hack's articles on the subject did not appear until many months later in the Berliner Klin. Wochenschrift, of 1882, and in his monograph, 1883; therefore, Hack was not the discoverer, and would only ask for the honor of a place among many other faithful workers in this field.

2. In the article referred to, it is claimed that nearly all cases of asthma are the result of disease in the nasal cavities. On the contrary all laryngologists know that only a small percentage of them are

3 It is also claimed that cauterization of the nasal niucous membrane will cure the majority of cases of asthma; whereas experience shows that it will benefit only a small percentage of them. With reference to the after effects of cauterization some discussion followed the reading of the paper, but it was not sufficient to make the matter clear. By experience we have found that the amount of discomfort following the operation is dependent on the idiosyncrasies as indicated by the rapidity with which wounds heal,

and these are likely to have much discomfort after cauterization.

Under certain, not well-defined conditions, small wounds heal very slowly on some in whom at other times cicitrization would be rapid. In such conditions a small burn which would ordinarily cause no inconvenience may be a long time in healing. Pa tients who are exposed after the cauterization sometimes, in popular parlance, "take a cold." and as a result a wound which would otherwise have healed rapidly may be a long time in closing, and inflammation may extend from it to neighboring parts.

In order to guard against these unpleasant results, care must be exercised not to cauterize too much tissue at one sitting. I have never known serious complications, or great discomfort to follow a single linear cauterization the whole length of the turbinated body, or a superficial cauterization nearly as large as a nickel; therefore wounds of this size may be he prefers some discomfort to a second visit to the doctor's office. In no case, however, should the cauterization be more extensive, because of the danger of facial erysipelas, and other unpleasant results. Whenever time and circumstances permit it will be found better to make a linear cauterization Laramie, Wyo. S. O. 14, Dept. Platte, Feb. 12, 1887. of not more than one half the length of the tur- Capt. M. C. Wyeth, Asst. Surgeon, ordered from Ft. Wayne, will be found better to make a linear cauterization binated body, or superficial cauterizations not more than an inch in diameter. If these precautions are followed, the author's statement that there is no noteworthy complication after the operation will be fully verified. Truly yours,

MISCELLANEOUS.

NECROLOGICAL.—Dr. B. F. Hardy died in San Francisco, November 22, 1886, of diabetes. He was a physician of more than ordinary education and professional skill, and has been a member of the American Medical Association since 1871. He leaves a wife and two little daughters to mourn his early departure. But of him could be said, "He followed virtue as his truest guide; he lived as a Christian, and as a Christian died."

DIED—January 9, 1887, in Milton, Ind., Dr. Joel Pennington, aged 88 years. At the time of his death he was the oldest practicing physician in Wayne County. He became a member of the American Medical Association in 1850. Through all his long professional life he enjoyed the confidence and esteem of both the community and the members of the profession who knew him.

EMIN PASHA, for whose relief Mr. Henry M. of the patient, the present condition of his system Stanley recently left England for Equatorial Africa, is no less a man than the celebrated Dr. Hermann his subsequent exposure, and the extent of the burn. Schnitzler, better known as Emin Bey, and Surgeon-There are some individuals, who from inexplicable General of the Equatorial Provinces under Chinese causes, suffer pain or develop fever from wounds Gordon. He succeeded Gordon in the governorwhich would not annoy the majority of mankind, ship, and has been engaged in bringing a barbarous region into a state of civilization. He has now been shut off from the outer world for three years by the barbarians to the north of him. He is a great linguist, and in addition to his medical learning has an intimate acquaintance with geology, botany, meteorology, anthropology, geography, etc. The little leisure which he has had for the past five years has been devoted to the sick.

> The Springfield, Mass., City Hospital has had bequeathed to it, in the will of the late Mr. Wm. Merrick, between \$75,000 and \$100,000.

What determining cause makes this difference is unknown.

Another class of inebriates are made so by states ef climate, food, surroundings, and occupation. Thus the alternations of extreme heat and cold seem to be active causes of the drink impulse. Firemen, stokers, and others, on Southern steamers which sail from Northern ports, subject to the sudden changes [from the frigid air of New York and Boston to the equator, generally become inebriates. A few years ago, Dr. Bowditch, of Boston, pointed out a drink belt, crossing the civilized world, in which spirits were used to great excess, on either side of which inebriety shaded down less and less, into comparative sobriety. In all probability climate is very active as a predisposing cause.

and innutritious food are the active causes. Thus, theory that it is a moral disorder which the victim are prepared to become inebriates on the slightest

Surroundings and kinds of labor are often active causes of inebriety. This is illustrated in many ways and in almost every neighborhood in the country, |

combined with many and most diverse influences which develop and keep up inebriety.

Another fact appears from a study of these cases, which is somewhat startling: they all begin at a certain point, and pass on down the same road, and uniformly cross the same bridges, reaching the same destination. Of course there are halts, variations, and changes, but the main body of inchriates move ness, and the same means are urged as a remedy. along one progressive line, from stage to stage. The expert has only to find out where the case started, 1886, and punished as willful and voluntary drunkand where it is at present, to predict the future. It ards. While the increased culture and intelligence of the degeneration. In these cases the drink impulse may race drives out the coarser and more repulsive sympthe victim. Of course every one subjected to such quiet pain. Inebriety is more concealed to-day, and injuries do not become inebriates. Many recover is followed by more allied diseases, and is more maniacal, suicidal, and impulsive. Pneumonia. Bright's disease, heart disease, apoplexy, are some of the names given to the fatal eases of inebriety. From all exact study we find that the causes of inebriety are physical, and can be traced to clear, tangible forces. The further study in this direction establishes this fact beyond doubt, and reveals vast stretches of unknown causes and conditions entering into inebriety, awaiting some future discovery.

> In the cure of inebriety there is probably more agitation and interest than ever before. The efforts of societies and parties, of the pulpit and rostrum, with the increasing books and papers from the press, have never been more active than to-day. Yet reports show that inebriety is increasing, and that more spirits are made and consumed every year.

All the temperance efforts and legal means for the In a certain number of cases of inebriety, bad cure and prevention of inebriety are based on the a child who has been underfed or overfed will have can control at will, or a wicked habit that he can digestive disturbance and an active predisposition to continue or put away at his own pleasure. This find relief in some form of spirits. In adult life the theory of inebriety is theoretical, and embodies the same thing occurs; the starved ones and gourmands same error which follows every new advance of thought, namely, explaining all human action from some moral or theological standpoint. Thus the phenomenon of insanity was explained as a possession of the Devil, and the victims were supposed to enter into a compact with evil spirits, voluntarily. These are only the most general cases, and are The remedy was severe punishment. Public attention was occupied for ages in persecuting and punishing the insane and epileptics on this theory of the causation. Law, religion, government, and public sentiment all failed in the cure and prevention by this means, and these diseases went on unchecked, simply because the real causes were unknown.

> Inebriety is regarded in the same way as wicked-Over fifty thousand inebriates were sent to jail in

found that most of his cases, which he thought cured some operation which promises a fair result and withafter resection or amputation, exhibited after a few in a reasonable time. years signs of tuberculosis in other organs or had meanwhile died from that cause. He thinks that such patients seldom reach an age above 40 or 50 years. Caries sicca seems to give a better prognosis as to life, but not so favorable as to the use of the joint, since it is apt to lead to anchylosis. Children are more favored in point of prognosis than adults. As long as we find pain in the joint on pressure or after use, even after all the swelling has subsided, we must still suspect some mischief.

Treatment.—Even before the tuberculous nature of white swelling was demonstrated, surgeons, with sound instinct, instituted a treatment similar to the one followed out in tuberculosis of other organs. Prepara class of eases laboring under a mixed form of atrotions of iodine, preferably iodide of iron, mercury, phic and hypertrophic catarrhal inflammation of the arsenic and cod liver oil, saline and sea baths, have for a long time been in use, not on account of their specific effect, but principally with a view to raise the state of nutrition. But, after all, we are compelled to look to local treatment for better effect. Absolute rest of the joint is without any doubt the prime condition, especially in cases with a tendency to ab-Plaster of Paris, or some similar bandage, unites with the immobilization of the joint the advantage of circular compression. But it is indispensable to put the leg in the proper position before bandaging and to correct any contraction. For the latter purpose weight and pulley are the best expedients in the knee and hip joint; forced redressment, place—in some cases it even seems to have a more curative influence, owing to the inflammation set up by it. After contracture has been removed a plasterof-Paris bandage is certainly the most convenient. Massage has so far not fulfilled our expectation in these cases; inunction, however, of iodine or mercurial preparations, also application of cold, may occasionally be of some benefit. Injections of carbolic acid into the joint have rapidly been abandoned. Ignipuncture of the joint, at one time highly extolled, seems only to be practised now by a few.

Whatever we may do in the way of conservative treatment, it will always require many months, and even years, for recovery, and then we find that some cases need a still more radical procedure. We may use conservative measures in younger persons, with the expectation of good results, when there is little swelling and the function of the joint moderately impeded; so also in the dry granulating form. The formation of a small circumscribed abscess, accompanied with some pain, is no special cause for discontinuing this plan of treatment. Even the graver with the prospect of an uncertain result, and if the of thickened structure with enlarged blood-vessels.

although very gloomy, are no doubt correct. He case is made plain to him he will no doubt prefer

(To be concluded.)

A MIXED FORM OF ATROPHIC AND HYPERTROPHIC CATARRHAL INFLAMMATION (HITHERTO UN-DESCRIBED), AND ITS TREATMENT.

Read before the American Rhinological Association, at St. Louis, Mo., October, 1886,

> BY P. W. LOGAN, M.D., OF KNOXVILLE, TENN.

I desire to present briefly a general outline of a upper air passages. In these cases there exists simultaneously and conjointly, hypertrophy and atrophy of the mucus membrane of the nose, nose and pharynx, or nose, pharynx and larynx. I have observed numerous cases of this form of inflammation, some of which were apparently so slightly affected, so far as structural changes and other evidences of inflammatory action were concerned, that some observers would, on examination, conclude that the affected structures were in a healthy condition. The condition of the diseased mucous membrane, however, varies,—the structural changes being greater in some than in others, and the quantity and quality of secretion also varies. Now and then we see hypertrohowever, under anæsthetic may also have its proper phy and atrophy apparently well marked co-existing in the same patient, but in many of these cases I have not noticed a decidedly pronounced morbid condition accompanied with the usual characteristic appearances present in either hypertrophic or atrophic inflammation occurring separately. In other words, this mixed form of trouble does not present the usual characteristics of either the hypertrophic or atrophic variety of catarrhal inflammation. The accompanying conditions seem to stop short of a well-developed hypertrophic or atrophic condition as described by various authors.

The mucous membrane does not appear dry and incrustated with inspissated secretions, as in the atrophic variety, yet there is not usually present sufficient secretion to normally lubricate the affected surfaces, and a dry sensation is complained of. Now and then I have noticed in children laboring under this mixed form of trouble, and in whom the hypertrophic condition predominated, excess of nasal secretion, but at the same time a dry sensation of the nose, or nose and throat was often present. In these cases I have found astringents objectionable, as they forms of fungus may derive some benefit from it as increase the uncomfortable dry sensation referred to. long as there is no extensive suppuration, but if the This effect of an application containing an astrinlatter should occur, with considerable pain and signs gent leads me to suspect co-existing atrophy. is shivering in the chill stage, it can often be aborted fairly successful in female children. — Provincial by the inhalation of a few drops of nitrite of amyl, Medical Journal, January, 1887. which will shoot the attack through chill and fever into the sweating stage in half a minute. This, of course, must be managed only by a physician, who easily-applied test for wall-papers has been devised should know with whom he has to deal before employing so powerful a remedy. I do not see why a congestive chill could not be controlled by the same agent, while the mustard frictions and hot whiskey and water in the rectum are used. But of this I have no personal experience.

[A hypodermatic injection of morphine will also] abort a chill, even after the cold stage has set in.]

Treatment of Nocturnal Eneuresis. — Dr. ALEXANDER HARKIN, in a paper on this subject, says:

A mode of treatment of encuresis founded on the theory of a hyperamic condition of the cord as its cause, would naturally proceed on the lines of lowering the chronic congestion of the organ, and thus it is that remedies such as belladonna and bromide of potass., sometimes relieve by their power of diminishing reflex action, and causing anæmia of the cerebral and on placing the charred end a second time, not organs, but their good effects are transient and not too far into the flame, the flame will now be colored always perceptible. I have long since discarded them as insufficient, and have adopted the use of derivatives and revulsives, such as dry and wet cupping, or blisters to the nape of the neck, applied as high as possible, and as close as circumstances will permit to the neighborhood of the foramen magnum occipitale and the region of the medulla oblongata.

In my experience I have had but seldom to apply to the cupping; one full vesication being generally sufficient: a blister three inches in length by two in breadth, either by emplastrum lyttæ, or by my favor ite remedy, the linimentum cantharidis of the Pharma is also sometimes more difficult of cure; this may be will in cases of successful search be obvious. accounted for by the anatomical peculiarities of Lancet, Jan. 29, 1887. stricture in the female organs, the urethra is only one and a half inches in length, and is much wider than muscle so distinctive of the other sex. It is also thirst of diabetic patients: generally well-known that females, even in waking moments, have not always complete control over the bladder and that the slight impulse communicated by a fit of sucezing, laughing or coughing, may at ation of its contents. My plan of treatment has Remèdes, October 1, 1886.

Five-grain doses in capsules, with a little there has not been a single case for more than a year had all recovered, only two having required a second After the beginning of the ague, when the patient application. In private practice, too, it has been

> SIMPLE TEST FOR WALL-PAPER.—A simple and by Mr. F. F. Grenstted. No apparatus is needed beyond an ordinary gas-jet, which is turned down to quite a pin-point, until the flame is wholly blue; when this has been done, a strip of the paper suspected to contain arsenic is cut one-sixteenth of an inch wide, and an inch or two long. Directly the edge of this paper is brought into contact with the outer edge of the gas flame a grey coloration, due to arsenic, will be seen in the flame (test No. 1). The paper is burned a little, and the fumes that are given off will be found to have a strong, garlic like odor, due to the vapor of arsenic acid (test No 2). Take the paper away from the flame, and look at the charred end—the carbon will be colored a bronzered, this is a copper reduced by the carbon (test No. 3); being now away from the flame in a fine state of division, the copper is slightly oxydized by the air, green by copper (test No. 4). By this simple means it is possible to form an opinion, without apparatus and without leaving the room, as to whether any wall-paper contains arsenic, for copper arseniate is commonly used in preparing wall papers. Tests 1 and 2 would be yielded by any paper containing arsenic in considerable quantities.—British Medical Journal, Dec. 11, 1886.

Entozoa and Pernicious An.emia. — Dr. G. REYHER, writing on the etiology of pernicious anæmia, points out that, as in a large number of copecia, applied vertically, suffices. - It is very seldom-these cases a Bothriocephalus latus has been diagthat a second application is required; occasionally, nosed and expelled by means of male fern, the paespecially in females, after some months of respite, tients subsequently recovering, and as the anæmia there may be a call for the renewal of the remedy; of miners is now known to be due to the Λ nchylosin obstinate cases and in grown up patients, dry or tomum duodenale, it is possible that all cases are wet cupping may be requisite to complete the cure. No. 65 RANDOLPH STREET,

THE RED CORPUSCLE AFTER TRANSFUSION.

From a clinical standpoint the question of the normal life-duration of red blood-corpuscles is chiefly of interest on account of its bearing upon transfusion of blood. As is well-known, the lamented Panum made the first direct attempt to ascertain the lifeduration of transplanted corpuscles, but by a method which was both crude and laborious-though he found that the red corpuscles were capable of living directly proportional to the quantity of blood inlife-duration was probably longer That the share taken by the liver in this process of count of the blood plasma. destruction is always considerable, but is always greater in dogs than in rabbits; 5. Since after trans-number of the corpuscles, experiments on animals

fusion of blood in conditions of health, the rate of destruction of the transfused corpuscles averages from 2 to 3 per cent. pro die in the rabbit, and is considerably more rapid in the case of the dog, to conceive of a condition, therefore, in which after transfusion of a small quantity of blood, for example, 3 or 4 per cent., the corpuscles may remain discoverable for a period of some days, is to conceive of a condition, which, in all probability, never obtains; and, while this is true of the rabbit, it will hold still more true of the dog (and, by analogy, also of men), in which animal the process of blood-destruction is normally more rapid.

We are not so much interested, however, in the manner of conducting the experiments, as in the conclusions which may be drawn from them as to the effect of transfusion upon man; and Dr. Hunter's paper is chiefly valuable to the clinician on account of what he says on this point. We cannot, on man, transfuse such large quantities of blood as to ascertain, by actual enumeration, the life-duration of the transfused corpuscles. Again, transfusion is practised upon man only in conditions of anæmia, and here the functions of the blood-forming or blood-destroying organs are altered or impaired. "We may assume that in man, as in the dog, the corpuscles after transfusion, will be disposed of with a rapidity at least five days after transfusion, and that their jected, and varying with the activity of the organs Twelve years concerned in blood-destruction, especially the liver.' after Panum's experiments Worm-Müller found by If, for example, "in a person weighing 112 lbs., the experiment that the longest possible life-duration of quantity of whose blood would be 138 oz., we transcorpuscles after transfusion in dogs was about two fused 6 oz. of blood (or 4.3 per cent.), the excess of or three weeks. Quincke's observations agree with corpuscles would under normal circumstances be this result; and experiments made by Dr. WILLIAM got rid of in all probability in a period of from one HUNTER, of the University of Edinburgh, and pub- to two days." But as we have seen, it is in condilished as a "Report to the Scientific Grants Com-tions of anamia that transfusion is performed; and mittee of the British Medical Association," still for the purposes of this discussion we may disregard further confirm the accuracy of the statement, traumatic anamia. We may regard simple anamia From his observations on dogs and rabbits he draws and chlorosis as due to a deficient blood-formation: the following conclusions: 1. The duration of life on the other hand, anaemia may be due to increased of red corpuscles after transfusion varies considera- blood destruction; due either to greater activity of bly in different animals, and in the same animal at the blood destroying organs, or to lessened vitality different times; 2. That the life-duration depends on of the corpuscles, or to both. "So far as my obtwo main factors, namely, the quantity of blood servations at present go, I am inclined to think that transfused, and the activity of the organs concerned the greater number of cases of aniemia, if not, inin blood destruction; 3. That the process of blood-deed all, may be referred to one or the other of the destruction is probably, under normal circumstances, first two conditions; either to diminish production more rapid in the dog than in a rabbit, and that this of blood corpuscles, or increased destruction." It is certainly the case after transfusion of blood; 4. will be understood that we are now taking no ac-

The amount of oxygen conveyed to the tinguished, and it must be remembered at the same tissues by the new corpuscles may be considerable at time that between the two there are many varieties first; but as this supply depends on the life-duration of intermediate forms. But the important point to of the new corpuscles, it is doubtful whether the remember in all of them is "that the condition of the operation is justifiable on this ground. Most probblood, as regards the number of corpuscles, does not ably, thinks Dr. Hunter, the beneficial results of in itself constitute the disease, but must be regarded transfusion are due to the introduction of a certain mainly, if not entirely, merely as the result of disease quantity of hæmoglobin into the system, which may -of morbid action in some organ or other of the serve as a stimulus to the blood forming glands, and body." Under such circumstances transfusion can thus stimulate them to an increased production of act only by modifying the nutrition of the body, and red blood corpuscles. This view is based on the dethis it can do in one or other of these ways (taking struction of blood in the liver, the spleen, and the into consideration only the red corpuscles): 1. bone-marrow, and the effect of an accumulation of Either by the blood-corpuscles continuing to live for blood pigment in the organs on the nutrition of the a certain time within the circulation, and continuing animal. An accumulation of pigment in the spleen to perform during that period all the functions of is both compatible with health and conducive to its those normally present; 2. By the introduction of a maintenance; but the accumulation of pigment in certain amount of oxygen along with the corpuscles the liver is always greatest when the animal's health at the time of transfusion, and the increased supply has suffered most—and this is readily understood of oxygen brought to the tissues while the corpuscles, when we remember the double function of the spleen hæmoglobin contained in the corpuscles.

When we contrast the appearance of a diminished production, the same argument cannot remain in the blood; 3. By the introduction of the -blood forming and blood destroying-and that pigment accumulated in the liver is effete matter, indi-We are thus enabled to form a tolerably definite, cating that a large amount of iron has been withdrawn disease."

Dr. Hunter's very interesting paper, containing an of half of a short, flat, or irregular bone. account of his experiments, may be found in the British Medical Journal, of January 29, 1887.

RESECTION AND EXCISION.

But as in all cases, says Dr. Hun- cision of the extremities of ulna and radius; resection ter, "only a certain proportion of the blood corpus- of upper end of humerus; the humerus is generally cles so introduced is destroyed by the double function resected in part, though it has been removed entire; organs, the remainder being disposed of by the liver, the scapula is resected for shot injuries, necrosis, and "and those proportions are determined by the rela-morbid growths . . . resection for necrosis should tive activities of the two sets of organs, it follows involve the entire bone; the spine, acromion process, that, in most cases of amemia, only a small propor and angles may be separately resected; resection of tion of the hemoglobin so introduced can be utilized cuneiform bones; osteoplastic excision of the foot for purposes of blood formation; and this proportion (possibly a new operation); the vertebræ have been becomes infinitesimal, and the value of transfusion subjected to frequent partial resections; portions of correspondingly lessened, in those cases of anamia ribs may require resection; resection operations on - for example, pernicious amemia-which in all the bones of the face; excision of half of lower jaw; probability depend on an excessive blood destruction resection of upper jaw." These are a few of the on the part of the liver, a destruction evidenced, many examples which might be cited. It will be amongst other things, by the extraordinary amount seen that the definitions practically exclude the reof blood-pigment found within the liver-cells in that moval of a portion of the shaft of a long bone, or of the articular extremity with a portion of the shaft, or

If we did not know where to go for information on this subject we might very properly ask for the authority upon which the words have been thus defined. In the 1874 edition of Dunglison's "Medical Dictionary" resection is defined as "Act of cutting or paring Surgical writers, especially those using the English off. A name given, especially by the French surgeons, language, seem to have fallen into hopeless confusion, to operations in which the carious extremities of long and a great deal of error, in regard to the meaning bones, or the unconsolidated extremities of fractured and use of the words resection and excision. This bones forming irregular joints, are removed with the is most prominently seen in three very recent works saw." This definition would be more nearly correct on operative surgery, in which we read the following: if the words "carious" and "with the saw" were "The terms excision, exsection, and resection may omitted. Webster's definition (last edition) of rebe applied without distinction to operations having section is: "The removal of the articular extremity for their object the removal of the articular extremi- of a bone, or of the ends of the bones in a false ties of bones, or of bones in part or whole" (Mears); articulation." This is not entirely inclusive, but "Excision of bone is a conservative operation, di- shows that resection does not mean the removal of rected to the extraction of such portions of it as are the shaft of a long bone. Excision means destrucinconsistent with the future usefulness or the symme-tion, extirpation. But perhaps it may be well to go try of the part, together with the removal of the back a few years and see what has been the usage of condition directly demanding the operation" (Bry- the words: In Littre's translation of Hippocrates ant). By the latter excision is employed to the ex- the words resection and resequer are used in the sense clusion of resection, which is not used in connection of removing a portion of bone. Benivieni, in writwith operations on bones. In a third, and still more ing (1520) of an operation, uses the words magna recent work, some attempt is made to distinguish the ossis parte resecuta. Park, who first resected the words: "The terms resection and excision are fre- knee in 1781, speaks of his operation as total extirquently used as synonymous, but though the defini- pation of the joint or section of the extremities of the tions of the two words are not unlike, there is a bones forming the articulation. Thirteen months different and distinct meaning attached to each when later Moreau operated on the tibio-tarsal articulation, properly employed. Resection strictly implies the and his son describes the operation as a résection, removal of the shaft of a long bone, while excision using the word in the titles of two papers (1803 and means the removal of the joint ends of the bones, or 1816). Syme wrote a "Treatise on the Excision of the extirpation of a short, flat, or irregular bone" Diseased Joints," and this is one of the earliest au-(Stephen Smith). To show how consistent the last thorities (if it be one) for such use of the word, exwriter is in applying the terms we may cite a few cept its use by James Jeffray, who also quotes Park

cine of Paris gave the following as the subject for a thesis: De la Résection et du retranchement des Portions d'os, etc. The title of Champion's Thèse, written in 1815, was Traite des Resections dans la continuite des os caries. Since that time we find that French and German writers uniformly use the word as we claim it should be used. Fancy a German using such a term as Gelenkexcision.'

In the Catalogue of the Library of the Surgeon General's Office we find resections tabulated under "Excisions." But on examining the list it will be found that in about 80 per cent. of the titles resection is the word used; that the word excision occurs most frequently in English titles, though resection is used in some of these; and that German, French, Italian, Spanish, Danish, Dutch, Norwegian and Russian writers use resection almost invariably in speaking of the operations on joints. We find German writ ers using Aussagung as synonymous with resection. Wagner uses the words "Resection und Extirpation" in a title, showing that he distinguishes them. ally, Ollier, of Lyons, who has made the most careful study of the subject, and everything connected with operations on bones, of any writer, says, in his Traite des Résections: We will only apply the name resection to the operation which consists in dividing a living bone and cutting off a considerable portion of it, preserving the soft and hard portions situated below it. By considerable portion, we mean so much as by its absence changes the external shape and relations of the bone. He does not use the word excision, because he says that some authors have used it synonymously with resection; instead of it he uses total ablation or extirpation; and he divides resections into two categories: 1. Resections of continuity, or osseous resections; and 2. Resections of contiguity, or articular resections. The term total resection he uses for an operation which removes "all the osseous extremities which constitute an articulation." It certainly does not seem reasonable to speak of total removal of the radius as a resection, and term total removal of a rib an excision; and at the same time use excision for the removal of the articular extremity of the radius. It is a confusion of terms, and warranted neither by good usage nor etymology. applied to soft parts excision is always used in the sense of extirpation, destruction, total removal; and resection in the sense of partial removal. We excise the tongue, spleen, kidney, larynx, tumors; we resect the intestine, tendons, pancreas, lung, etc. There seems to be no reason for completely changing the meaning of a word according to the structure or location of a part operated upon.

NEURASTHENIA AND NEURATROPHIA.

In the Philadelphia Medical Times, of January 22, 1887, is a leading article in which it is said that the term "neurasthenia" was coined by Dr. Geo. M. BEARD, from a term "nervous asthenia" used by Dr. Fordyce Barker, and that Dr. Beard wrote the first accurate description of the condition. Other writers have made the same or a similar error. Dr. Beard did not invent the term, nor was he the first American writer on the subject. His first contribution appeared in the Boston Medical and Surgical Journal, on April 29, 1869. Dr. E. H. Van Deusen, of Kalamazoo, Mich., wrote the first systematic paper on the subject in 1867, and was the first to call attention to the theory of its being associated with an underlying neuropathic diathesis (Michigan Asylum Reports, 1867); a theory which the Medical Times credits to Arndt (Die Neurasthenie; Wien: 1886), but which has been a profound conviction with advanced neurologists since the appearance of Van Deusen's paper. Not did he coin the word; it may be found in Dunglison's "Medical Dictionary," Edition of 1856. In a late article Playfair objects to the term, but finds nothing better; though neuratrophia expresses the underlying organic condition of all forms of neurasthenia. It expresses a state of nerve starvation due to causes inherent in the nervous system itself, having its appropriate symptomatic expression in nervous exhaustion, and its immediate consequences (Alienist and Neurologist, July, 1882). In the Alienist and Neurologist, of October, 1880, may be found a paper by Dr. C. H. Hughes, of St. Louis, giving full credit to Van Deusen for his work in this field.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, January 12, 1887.
The President, Jos. Taber Johnson, M.D.,
in the Chair.

H. M. Cutts, M.D., Secretary.
Dr. J. Taber Johnson read a paper entitled
can the clesarfan section be safely substituted
for craniofomy in the united states
at the present time?

(See JOURNAL, Feb. 12.)

DR. T. E. MACAKDLE said that no one listened to Dr. Johnson's paper with greater interest than himself. If two years of careful study had accomplished so much for him, he felt quite sure that he will stand

To attain this con- craniotomies, and when we have taught its various summation in the goal to which humanity points, alternatives a little more thoroughly, there will be And science in this respect, as in many others, is unfewer in the future. tiringly striding towards the fulfilment of the dictates of humanity. That science will ever achieve all labor, by Barnes, has already saved many from cranithat humanity longs for may be doubted; but the otomy, even by the advocates of the operation. pursuit is a noble one, and cannot fail to bear good. The argument that we cannot recognize the deformity fruit."

or otherwise, we have arrived at this point—there is ing the incapacity of the mother before term, be a viable child; it cannot be brought living through taught, and we shall have more induced labor and the pelvis; a momentous question confronts us, fewer craniotomies. Craniotomy is a comparatively Shall we deliberately sacrifice it, by perforation or rare operation. Tyler Smith estimated that it was equivalent operations, so as to save the mother from done only about once in 500 labors, and now it the perils attendant upon attempts to deliver per must be even rarer. It is admitted that, with a convias naturales, or by Casarean section at a time se-jugate diameter of, or below, two inches, craniotomy lected when the child is viable? In such a case, the is more fatal than Casarean section. Now, if the tion, as a real alternative of craniotomy. If the op-pared, they ought to be measured by their respective portunity of election between the induction of labor results in like conditions of pelvic obstruction below to be completed by craniotomy, or to be evaded by the maximum conjugate, at which either is admissiface to face with labor at term, the pelvis deformed craniotomy its disastrous results to mothers in the beyond the reasonable probability of extracting the higher grades of diminution of the conjugate and feetus by embryotomy with safety to the mother, the the total loss of children at all grades. Cæsarean section has become an operation of neces-

thing in the word, or in the suggestion of the fact trasted the two operations as follows: that something is killed, seems to give them umbrage. A more moderate word might be found, but the act should be described as it is, "killing at will." If the operation is not done in the truest belief and the firmest conviction of its right, in the mind of the operator, then surely there can be no excuse for it. The act of destroying must be not only the result of deliberation, but of conviction, else it is criminal. favor of craniotomy as an argument in defense of those who may not be competent to perform Casarean section, or to determine the proper relation of results of Casarean section have been: either to the case. Also against what he styles a cast-iron rule, i. e., not to kill one that the chances of the other may be improved, but to pursue that course which gives a chance to both and saves most lives. Surely it cannot be an argument in favor of craniotomy, that it cannot be performed by unskilled surgeons. This cannot be the scientific way of reresolve to kill, or to resolve not to kill? Which is before quoted. Barnes concludes: most likely to promote the killing, a rule that you

Dr. C. N. Seltzer said: I have seen three cases

Dr. Joseph S. Neff said: It is well known that any bad results.1 It has been demonstrated time puss from a hepatic abscess rarely contains liver and time again, that the entrance of air into such a debris, because most abscesses in this situation are cavity through an incision is not necessarily attended surrounded by dense walls of pyogenic membrane. by decomposing action and death, but, on the con-trary, a complete evacuation is obtained, reaccumuthe liver substance projects in shreds into the abscess lation prevented, and the threatened death by ex- cavity, are cases of diffused abscess, which are very

In the circumscribed abscesses of the liver which less to remain behind, will, in addition to that con-different direction from that in the case reported. I have seen only one case in which the abscess was opened through the abdominal walls. That was the case of a man in the Jefferson College Hospital.

¹Since completing these remarks, I notice in the January 1st number of the Medical News, a report of a "Case of sudden death from the introduction of an aspirator needle," by Dr. Reeve, of Dayton, Ohio

The abscess was tapped a number of times, but as peritoneum. In the course of twenty-four hours a localized peritonitis had existed. there will have been some local peritonitis with the formation of adhesions, and then the operation is completed. Dr. J. M. Barton operated in my case, and after cutting through the abdominal wall with a scalpel, a white hot knife was used in order to avoid hæmorrhage from the liver structure. After the liver had been penetrated to a short distance, the knife failed to act satisfactorily, and the operation was completed with a soft gum catheter. In the case reported, the cause of the affection and the youth of the patient are also points of considerable interest.

Dr. Seltzer said that his remarks were based on the statement, that this was an acute diffused hepatic abscess, and not one surrounded by pathogenic membrane.

Dr. Vogler said he had no doubt whatever as to was read by the Secretary. the diagnosis of the case. The situation of the abscess, enced no trouble.

(To be concluded.)

GYNÆCOLOGICAL SOCIETY OF BOSTON.

Stated Meeting, November 9, 1886.

THE PRESIDENT, H. O. MARCY, M.D., IN THE CHAIR. 11. J. Harriman, M.D., Secretary.

The tumor weighed 834 lbs. after the blood was the man was evidently sinking, it was decided to removed. It was not as firm as an ordinary fibroid, open it through the abdominal wall. One of the but to the touch was resilient and comparatively soft. dangers of this operation is that pus may escape into. These peculiarities led to a mistake in diagnosis. The the abdominal cavity. In performing this operation, autopsy revealed the fact that about five ounces of some operators at the first sitting cut down to the blood had oozed into the abdominal cavity, and that

Dr. H. O. Marcy presented

A DERMOID CYST WITH BONY WALL.

The interesting feature of the specimen was that a plate of real bone existed in the lower portion of the sac, from which a long spine projected into the cyst. The Fallopian tube was spread out over the tumor in the line of incision, and, being congested, it made it difficult to determine whether the tumor was ovarian and cystic. By the vagina the hard bony mass could be distinctly felt, and this fact led to the opinion that the tumor was fibroid.

In the absence of Dr. Thornton Parker, his paper, entitled

THE REMOVAL OF A LARGE VAGINAL TUMOR,

This case occurred in the practice of Dr. H. R. the fact that the pus was mixed with biliary matters, Storer, of Newport, R. I. Patient 35 years old; twice the fact the finger could be introduced through married, and has had one child at a normal labor. the cut two inches under the ribs, and the very grave. Health good until four years ago, when she became constitutional symptoms, were sufficient to indicate seriously menorrhagic. When medical aid was sought the seat of the disease. I unfortunately neglected it was found that the vagina was entirely filled with a to make microscopical examination of the pus. As mass resembling in shape a pear with its base upwards. Dr. Neff has said, it is not necessary that disin. As the uterus could not be felt above the pubes in tegrated hepatic structure shall be found, for many its natural position, it was at first thought that it was of these abscesses are localized. I thought that in one of the rare cases of spontaneous uterine inverall probability adhesion had formed between the abssion. A catheter could not be made to fully enter dominal wall and the liver, and in operating 1 experithe bladder. In the lower abdomen was found an obscure mass lying obliquely from below to the right, which moved with the tumor. With difficulty a sound was introduced into this mass a distance of $2\frac{3}{24}$ inches, thus settling the diagnosis of a very large fibroid tumor situated in the vagina. An operation was decided on and an ecraseur applied, but the chain broke. The operation was abandoned for the time and no unfavorable symptoms followed. Several days later removal was again attempted and was successful. There was virtually no hæmorrhage. After the tumor was severed it could be rotated in the vagina, but could not be removed in the ordinary way on account of its size. Strong, straight hooked forceps in the grasp of a strong man failed to deliver the tumor. It was determined to produce expulsion by pressure superiorly and from within, in imitation of the powers of nature during labor. The sphincter ani having Patient was 38 years of age; unmarried; menses been forcibly dilated, Dr. Storer introduced his foreregular; uterus free, and sound entered the normal arm into the rectum so far that the fingers entered the fundus. There was one small adhesion to the The vagina was then plugged. The case recovered tumor was found firm, homogeneous and fibroid.

which in some respects resembled the one narrated upon patience. in the paper. In his case the fibroid was attached to We find on reading the introduction that this book the fundus uteri, and, as it was too large to be re was written for the general practitioner; and of all moved whole, it was cut up with the ecraseur and American works on nervous diseases which we have removed in pieces. Dr. Brown thought that a simi yet seen, this is the most intelligible to one who is lar procedure might have been adopted to advantage not a specialist in neurology. It goes over the in this case. Putting the arm into the rectum is a ground as the physician must go-from symptoms barbarous and unnecessary practice. He regarded back to lesions, and not from lesions to symptoms, it as bad practice to attempt to remove a whole which is the route followed by other authors of such tumor when it could be more easily and safely re-books. Further than this it is scarcely necessary to moved piecemeal. The interests of the patient should notice the work, except to say that the only sense be of first importance.

saw no need of the ccraseur in this case, and thought described. Should this be added in subsequent edithat the mucous membrane might have been cut and the tumor removed in pieces. He regarded the in troduction of the arm into the rectum as bad surgery and a somewhat violent mode of procedure.

Dr. E. C. Keller had removed tumors similar to the one described by means of strong vulsellum

Dr. H. O. Marcy would remove such a tumor by splitting it in pieces and, as it were, shelling it out of its envelope. He mentioned a case which was presented to the Society of a similar tumor which he had removed in fourteen pieces. Dr. Marcy regarded the écraseur as a clumsy and bungling instrument, and thought that other instruments would serve the same purpose with better results. He had introduced the arm into the rectum without doing injury, and held the opinion that it was a justifiable mode of procedure in the diagnosis of some cases of obscure pelvic disease.

Dr. R. L. P. Goodwin mentioned two cases of impaction of fieces caused by eating stick cinnamon which he had successfully treated by dilating the rectum and forcibly removing the impaction.

Dr. E. W. Cushing exhibited to the Society by means of the microscope specimens of the Gonococcus.

BOOK REVIEWS.

Treatise upon the Phenomena produced by Diseases of the Nervous System, with Especial Reference to the Recognition of their Causes. By H. Fevers. C. WOOD, M.D., LL.D., Member of the National phia: J. B. Lippincott Co. 1887. Chicago: W. errors. Keener.

The first, and only, complaint that we have to make is that it is not stated in the title-page that the distinguished author of this book is the University of Pennsylvania Professor who has given us a work on Materia Medica and Therapeutics, and who has contributed so much to the subject of fever, and to the highest class of medical literature in this country. SECTION ON MEDICAL CLIMATOLOGY AND DEMOGRAPHY The author need not have apologized "for trespassing upon the patience of the profession;" he is too well and too favorably known as a writer for any-

Dr. W. Symington Brown described a case of his thing he should write to be considered as a trespass

in which it can be said to be incomplete is that it Dr. E. W. Cusming agreed with Dr. Brown. He does not treat of the therapeutics of the conditions tions the general practitioner will be under still further obligations to Professor Wood.

> CLINICAL THERAPEUTICS. Lectures in Practical Medicine delivered in the Hospital St. Antoine, Paris, France. By Professor Dujarden-Beau-METZ, Physician to the Cochin Hospital Member of the Academy of Medicine, etc. The Treatment of Nervous Diseases; of General Diseases; and of Fevers. Translated by E. P. HURD, M.D. 8vo. Detroit: Geo. S. Davis. 1885.

> That a book by the distinguished author of this work is worth reading goes without saying. It is most readable in style and deals with subjects intrinsically interesting. It is not a text-book, but a book rather for the practitioner than the student. It might better have been entitled a treatise on certain topics of clinical medicine than therapeuties. It is true, however, that for the most part it deals with methods of treatment, but does not ignore symptomatology and diagnosis. We recommend it to our readers with pleasure.

Chapters are devoted to the following subjects: Clinical Therapeutics; The Nervous System from a Therapeutic Standpoint; Hydrotherapeutics; Medico Electricity; Treatment of Neuralgia; of Hysteria; of Epilepsy; of Chorea; of Meningitis; of Apoplexy; of Chronic Myelitis; The Blood from a Therapeutic Standpoint; On Blood-letting; Treatment of Anæmia: of Acute Rheumatism; of Chronic NERVOUS DISEASES AND THEIR DIAGNOSIS: A Rheumatism and Gout; of Diabetes; of Syphilis; Fever from a Therapeutic Standpoint; Treatment of Typhoid Fever; of Intermittent Fever; of Eruptive

MISCELLANEOUS.

DETECTION OF BLOOD-SPOTS ON IRON.—Dr. Dannenberg contributes some valuable data on detection of blood-spots on iron. Blood is easily proven on ordinary surfaces by means of the crystals of haemine, but when blood-spots on rusty iron are to be examined their detection is not so simple a matter, as the iron rust seems to form a combination with it. Dr. Dannenberg, however, states that if a few drops of a 10 per cent. solution of caustic potash be placed on the spot, and thus loosened, the rust scraped off and segregation versus aggregation of invalids at health and treated with ammonium sulphide and water, and then handled according to the usual method, elegant extended rhumbic crystals will be formed. He considers these as conclusive proof and names them "Haemidin" crystals.

Cocaine Legislation.—On February 15, Dr. J. B. Mattison, of Brooklyn, read a paper on "Cocaine Dosage and Cocaine Addiction" before the King's County Medical Society, after which Drs. Wallace, De Lavergne and Mattison were appointed a committee VIII. Collective Investigation, apart from aiding to draft a bill, for presentation to the Legislature, placing cocaine on the list of poisonous drugs, and to

Disinfecting Stations.—Several disinfecting stadaily sickness and consequent loss of time, occupa- tions were established in Berlin on November 1, and their use is compulsory by the police regulations. Within six weeks after their establishment 10,593 pieces were disinfected, mostly belonging to persons infected by diphtheria and scarlatina.

> DIPLOMA MILL IN MAINE.—The *Boston Herald* has recently ventilated an extensive diploma industry in Lewiston, Me., a representative of that paper, who says that he is innocent of any knowledge of medicine, having obtained without difficulty a diploma from the Maine Branch of the "Druidic University of America." As this "Branch" is incorporated under the State law, the people of the State must now pay the expenses of "a joint special committee" from the House and a few Senators, "to inquire into the expediency of repealing" the character of the Maine Branch and the Maine Eelectic Medical College.

ORIGINAL LECTURES.

THE SYMPTOMS AND DIAGNOSIS OF MULTIPLE NEURITIS; WITH REPORTS OF CASES.

Based on a Clinical Lecture Delivered at the New York Post Graduate Medical School, Januar v 18, 1887.

BY CITARLES L. DANA, M.D.,

PROFESSOR OF NERVOUS DISEASES N. V. POST-GRADUATE MEDICAL SCHOOL; VISITING PRYSICIAN TO BELLEVI'E HOSPITAL.

A very good description of multiple neuritis was now forthcoming.

case running a course of four and one half months, atrophic cells in the lumbar cord. and having the type of the subacute spinal paralysis of several years, and started from a contusion of the the subject in 1883. sciatic. Eichhorst's case³ came next. It was like nerve trouble, not a simple degeneration. Then of Medicine, Vol. xii, p. 33. See also articles by Déjerine reported a case also resembling acute ascending paralysis. He found also neuritis, including some changes in the anterior roots. Neither Eichhorst's or Déjerine's cases are very complete. Eisenloht reported a case of subacute paralysis and autopsy. The cord was normal, the sciatic showed parenchymatous and interstitial neuritis.

Joffroy contributed a very elaborate paper to the Arch. de Phys. Normale et Path., No. 2, 1879. He describes: 1. Spontaneous parenchymatous neuritis. 2. Neuritis from lead poisoning. 3. Neuritis in the course of infectious diseases. Under the first division he describes cases of multiple degenerative neuritis, with autopsy. Lancereaux reports a case of this kind occurring in phthisis, as do Desnot and Pierret.

In 1880 Leyden's summed up the work of his predecessors, and reported a case of his own, with autopsy. He gave a systematic clinical history of the disease, and one which is still quite correct. Leyden was followed by Melchert.*

In 1882 Scheube, and in the same year Baelz, given by Leyden in 1881, again by Piersson in 1883, showed that the nerve symptoms of beri beri were and by Strümpell in his "Text book on Medicine." due to a multiple neuritis. Koeniger, writing on Dr. X. Francotti, in 1886, described it well; so also this same subject in 1882 and 1884, alleged that the did Dr. Buzzard in the Harveian Lectures for 1885. neuritis was only a complication. Ballet, in 1883. Dr. Gowers gives a very complete account of the found atrophy of the anterior cornua in beri beridisease in his recently published text book on ner- nerves not examined. Haradan found neuritis and vous diseases. Dr. M. Allen Starr will no doubt degenerative changes also in anterior nerves in dorcover the whole ground in the most thorough manner sal and lumbar regions. M. P. Mendesⁿ found lein the Middleton Goldsmith Lectures on this subject, sions in the nuclei of the columns of Goll, and in the posterior columns, especially, of the cervical and I venture to give here some notes on the history lumbar cord there was atrophy of cells and parasites of this new development in neuro-pathology, since it in vessels; also a neuritis as far up as the spinal ganhas made such a change in some of the conceptions of glia. Tschowskii2 reported several cases, with auparalytic disorders. Dumenil, in 1864, reported a topsy in three. He found multiple neuritis, and also

After Leyden's communication there were soon of Duchenne. The autopsy showed diffuse lesion of published a large number of cases, by Hiller.13 Granthe nerves, the brain and cord being normal. Strumpell,29 by Dr. Dreschfeld,30 and by Schultz,41 These writers give a full history of this special subject up to the date of this writing.

studied by the writer, and a full account of it given in Brain, January, 1887. In the same article the history of the relation of lead-poisoning and of diphtheria to multiple neuritis is given. In the past year weeks, or even less. The symptoms then gradually a number of additions to our knowledge have been made, all of which are to be summarized and presented by Dr. Stair in the lectures referred to.

In a thesis entitled "Des Pseudo-tabes," by L. Leval Picqueche (Paris, 1885), a very complete history of this form of multiple neuritis, from various causes, is given. Dr. Starr has also called my atten-Toxiques." by Broussais, of Paris.

The symptoms of multiple neuritis develop in two or four years, e.g., Dumenil's case. forms; 1st, those of atrophic motor paralysis with subsidiary sensory changes; 2d, those of ataxia and cally from the disease ordinarily known as subacute other sensory disturbances with only moderate mo- multiple neuritis. tor paralysis. The motor form is the more common. sult of poisons or the infection of diphtheria.

erally come on rather suddenly, and are sometimes; of weakness, and the paralysis steadily increases until the patient is unable to walk or use his hands. | tor form. The lower extremities are oftenest and most seriously affected, the upper extremities next, and the muscles! of the face and trunk least often of all. The flexors of the foot and the extensors of the hands are particularly attacked. The paralyzed muscles speedily become atrophied. The bladder and rectum are not affected. The sexual power is lessened. The pulse is generally quite rapid, owing, perhaps, to involvement of the vagus.

On making a physical examination the skin is generally found hyper-æsthetic, and yet there may be some tactile, thermal and pathic anæsthesia. Later this generally develops. Pressure along the course of the nerves and over the muscles causes much pain, as do muscular movements.

Electrical examination of the muscles shows generally a partial degenerative reaction, the muscles being less irritable than normal to both galvanic and fairedic currents. The contractions are sluggish, but

Eisenlohr, a Strümpell, Moeli, Hirt, Löwenfeld, it is not common to get polar changes. The nerves show also diminished electrical sensibility, but fur-The relation of alcoholic paralysis was studied by hish no positive indications of neuritis as against polio myelitis, though perhaps their irritability is less. There are not usually any marked vaso-motor phenomena except ædema. Sometimes the secretion The relation of arsenical paralysis to neuritis was of sweat is profuse, and in arsenical cases 1 have seen the feet and hands shed the epidermis as it it had been raised by a blister.

The disease reaches its height in two or three ameliorate, and the rule is a progressive improvement ending in cure in four to six months. In some cases the spinal cord apparently becomes involved, and the sphincters are paralyzed; diabetes and various other central symptoms appear.

Some cases of multiple neuritis run a very acute course, and present the symptoms of acute ascendtion to a very complete work entitled "Paralysis ing spinal paralysis (Landry's paralysis). Other rare cases present a slowly progressive course lasting three

These types are different clinically and etiologi-

The Sensory or Ataxic Form is spoken of by Gow-The sensory or ataxic form occurs chiefly as the re- ers as rare, but I have seen quite a number of illustrations of it. Case 7.—Neuritis Complicating Locomotor Ataxia. I have shown to the class on several occasions a Case 4.—In the second case the patient, a man of patient who had had for a year some slight ataxic 45, was taking Fowler's solution in daily doses of symptoms, but had been able to do his work, that 3iss, and he gradually developed a pseudo tabes sime of a brakeman, every day, and who believed himself ilar to that above recorded, but milder in type. His to be suffering only from a paralysis of the left third symptoms, too, improved, and he was finally left nerve, which was of several years duration. One

day, not feeling very well, he took a Turkish bath, and next day was in bed with an intensely painful eration in lead paralysis. Beiträge zur Path. u. Path. paralysis of the lower extremities. There was exquisite tenderness along the course of the nerves, 131. So did Kast (Centralb. f. Nervenheilk, No. 8, burning feet, pronounced ataxia, and abolition of knee- p. 137). jerk. The symptoms seemed to point to the development of a neuritis complicating the original poster in a case diagnosticated at the time as polio myelitis rior sclerosis, and this is an accident which I believe anterior subacuta, but which gives much such a hismay sometimes occur in true locomotor ataxia.

always be made with certainty. It must be based,

3d, upon the course of the disease.

Diagnosis from the Etiology.—Painful symmetrical progressive paralysis, with atrophy coming on after degeneration-reaction. an attack of theumatism, is probably neuritic.

The same may be said regarding attacks coming on in alcoholic patients. The post mortem evidence ened; E, irritability lessened or absent. collected by Dreschfeld, Schultz, Francotte and paralysis are of peripheral origin. Some are, however, I believe, myelo-nenritic.

The paralysis from arsenical poisoning, bi-sulphide and oxide of carbon, and in some cases after the use of lead, are peripheral. The pseudo-tabes after diphtheria and in diabetes is neuritic, but glycosuria may

occur in true tabes.

The paralysis and pseudo-ataxia after infective diseases, diphtheria, variola, pneumonia (Virchow's Arthe course of acrodynia and beri beri, are neuritic.

It is not yet demonstrated that multiple neuritis Webber and Chapin have reported cases which applation of the paraesthesia of the extremities, are diag-

pear to belong to this category.

Diagnosis from the Symptoms.—Rather sudden onset with marked pains in legs and arms, and sometimes fever, followed by rapid symmetrical atrophic multiple neuritis. Hyperæsthesia is present at first, with great tenderness of muscles and along the course, ascending paralysis or poly-neuritis. of the nerves. Later tactile and thermic anæsthesia of moderate type develops.

The specially characteristic symptoms in detail, are: Symmetrical ascending paralysis affecting the atrophic paralysis, with highest grade diminution of

fect and extensors of arms.

ports a case of generalized neuritis with marked ence of skin reflexes; tenderness over the great electrical alterations of non-paralyzed nerves and nerve trunks; pains on starting to walk; the even-muscles. It was in a woman of 30 years, and fol-tual return of the tendon-reflexes and normal eleclowed acute rheumatism. This was followed by trical irritability. The bladder and rectum were, burning pains and numbness of the legs and arms, however, somewhat affected. with intention-tremor and some atrophy of hand muscles.

Œdema is often marked, without albuminuria. The pulse-rate is high. Sphincters not involved; no decubitus. The face and eye muscles are rarely involved, but occasionally there is optic neuritis. Optic neuritis has been noted by Eichhorst (Virch. Archiv., 1876, Bd. 69, p. 69); Strümpell (*Archiv f. Psych.*, Bd. 14. p. 339); Löwenfeld (Veber Multiple Neuritis, 1885, p. 15); E. chir, Vol. 68), measles, typhoid, and occurring in Remak (Neurol. Centralbl., No. 14, 1885); Dana (*Brain*, June, 1887).

The burning hands and feet, the peeling of the occurs in children except from beri beri, although skin of the extremities, the sometimes sharp demark-

nostic points to be noted.

Favorable termination favors the diagnosis of multiple neuritis. The presence of degeneration reaction with retention of voluntary movement favors polioparalysis, are the main characteristics of subacute myelitis. Localization of paralysis in physiological groups of muscles favors polio-myelitis, symmetrical

The diagnostic points in a case of Schulz's seen by Strümpell were: The multiplicity of the processes attacking the extremity nerves; high grade lower extremities most, and especially the flexors of electrical irritability, without quantitative changes; the slight paræsthesia without anæsthesia; the joint Diagnostic Electrical Reactions. E. Remak re- affection; the absence of the tendon-reflex with pres-

Diagnostic signs given by L. Löwenfeld in a case of rheumatic multiple neuritis with athetosis were: Motor weakness with fever and sensory disturbance limited to certain nerves; girdle sensations and great yzed, only react to severest electrical currents and sensitiveness of the back muscles; absence of pupillary, bladder, rectal and sexual symptoms; girdle Ethnoted the degeneration-reaction (milder form) sensations about the extremities; electrical reactions in non-paralyzed muscles—head paralysis (Arch. f. were those of partial degeneration-reaction; there Psych., 1885, v. p. 445). Also Bernhardt (Berlin, was striking diminution of electrical irritability to klin. Wochenschr., 1878, Nos. 18 and 19), and Buz-hoth currents, with slight polar changes. This has been found by Brenner and Bernhardt also.

The ordinary course of an acute poly-neuritis is, according to Roger: 32 Sharp attack, with severe pains in extremities, oftenest in lower; often a fever; then paralysis, without contractures, with rapid atrophy. Hyperæsthesia is followed by anæsthesia; tenderness; electrical degeneration reaction.

Initial pains, early, marked sensory disturbances, combined with degenerative muscular atrophy and paresis of extremities, following acute articular rheumatism, point to subacute multiple neuritis.33

Some particulars may be given regarding the diagnosis of the different forms of multiple neuritis:

:. Alcoholic neuritis runs a less acute course, is less progressive, and the paralysis is more confined to the extensor groups. The legs alone are often affected. There is a characteristic hyperæsthesia and hyperalgesia. Cerebral symptoms are frequent. The gait in the pseudo-tabitic cases is modified from that of true tabes by the fact that, the extensors of the feet being paretic, the foot is brought down flat.

by Oetlinger (loc. cit.), are: The symmetrical paralysis, almost always beginning in the lower extremitiant of multiple neuritis, with, on autopsy, evidences ties, and affecting especially the common extensors of both neuritis and myelitis. Eisenlohr has reof the foot and the extensor hallucis. Bladder, rec-ported a case that is particularly striking. J. J. tal, facial and eye paralyses are not present. Ataxia Putnam reports two cases of painful myelo-neuritis. is not constant, nor are contractures. In chronic forms there is hyperesthesia; in acute forms analge- jerine reports³⁶ two cases of tabes with extensive desia. Generally there there is cedema and trophic disturbances of the skin. Tendon reflex always ab-

The prevalence in women was not observed by Octlinger. The ataxia was static only in a case described by Lilienfeld.

Besides the points given, the alcoholic patient may of the direct cerebellar tract. suffer from central scotoma; tabetics have a more general narrowing of the visual field (Bernhardt).

Optic neuritis is seen in acute myelitis, multiple sclerosis, multiple neuritis, and alcoholic neuritis, but never in true tabes.

There are mental disturbances in alcoholic cases, and women are oftener affected.

The degeneration-reactions are temporary, and only noted at the height of the disease. The ataxia is static only in some cases. There may be rapid pulse and hyperidrosis.

In arsenical neuritis, a characteristic trophic disturbance is the entire shedding of the epidermis of the feet and hands. A hysterical mental condition is sometimes present. The paralysis may be motor and atrophic, or may take a pseudo-tabetic form, the last being rare.

by the changed electrical reactions (high grade diminution of E. irritability, with or without qualitative changes). In tabes, at the beginning, there may be an increased E. L., which later decreases without any it is indeed surprising to see the rapid general imdegeneration-reaction.

There is an ataxic neuritis seen in early atrophic paralysis.

The pupillary symptoms, girdle pains, bladder and rectal disturbances are, as a rule, absent in neuritis. There may be slight pelvic symptoms in ataxic

The tendon reflex, though apparently absent, may be brought out sometimes by Jendressik's method in neuritis; never in tabes (Moeli).

In post diphtheritic multiple neuritis there are generally paralyses of the soft palate first, then general muscular feebleness, ataxia and loss of tendon reflex. In a few cases the external eye muscles are affected, causing exophthalmoplegia externa. 4

Subacute multiple degeneration neuritis is to be distinguished clinically from acute ascending spinal paralysis (Landry's). In the latter disease there is, it is true, a multiple neuritis, in some cases at least, but its cause and course, as well as the anatomical changes in the nerves, are different.

Myclo neuritis .- Multiple neuritis may be combined with a polio-myelitis, and then symptoms of The diagnostic signs of *alcoholic neuritis*, as given both diseases may be present. Leyden, Rosenthal and Dejerine have found cases running a course like

> Central spinal lesions predispose to neuritis. Dégenerative neuritis.

Illustrations of symmetrical ascending neuritis and myelitis are given by Grainger Stewart, who reports There are three forms: mild, chronic and acute, three cases. The patients showed the signs of multiple neuritis with ascending paralysis, beginning in all four extremities. Post-morten examination showed secondary degeneration of the columns of Goll and

TUBERCULOSIS OF BONES AND JOINTS.

Read before the Northwestern Ohio Medical Association, at Lima, Ohio. December 9, 1886.

BY M. STAMM, M.D.

OF FREMONT, ONTO. (Continued from page 262.)

Cases of tuberculous dropsy of the joint should, as soon as diagnosis is possible, be operated upon, as all other means will have little effect. This operation generally consists in making incisions into the joint, removing the swelled synovialis. After having washed out the joint with disinfecting fluid, dust it over with iodoform, put in drainage-tubes, etc. The idea of preventing the spread of tuberculosis from A multiple neuritis of the sensory or ataxic form an affected joint is less an indication for operative is differentiated easily from locomotor ataxia usually, measures than the local condition itself. Such measures, amputation especially, may sometimes be called for to cut off the dangers of septicemia, pyæmia and amyloid degeneration of the kidney and other organs;

seasons for a period of eleven years is shown to be that most interests the invalid is that here can be

as follows:

Spring		 		10.1 inches.
Summer.		 		13.5 "
Autumn .		 		7.1
Winter		 		0.5 "
		 	_	
Tota	1	 		4.02

Temperature.—The record at Asheville shows the following mean temperature for the seasons:

Spring	54.3 deg. F.
Summer	71.3 "
Autumn	55-3 "
Wmter	27.2
-	
Vearly mean	55-3

In a series of nine years the mercury did not rise above 90° F. any day in the summer. During this season the nights are always cool, permitting refreshing sleep. In winter it is very seldom that a zero temperature is reached, while the air is comfortable, dry, clear and invigorating.

Dr. H. O. Marcy, of Boston, who has personally investigated the claims of this region, says he has sent a large number of patients there with excellent results. And there is not wanting testimony from many physicians who have seen the benefits which result from a residence there during the spring and summer months.

However, there are places more accessible to perreached by Northern tourists is

MARIETTA, GA.

The society in Marietta is composed of cultured, The average rainfall in inches of the different kind hearted and hospitable people. And the fact found all home comforts. It is not a place where the necessities, not mentioning the luxuries, of life are

absent.

The temperature of Marietta is mild throughout the year. In 1885 the lowest mean monthly temperature was in January, 30.3° F. The yearly mean temperature was 59.4° F. During the winter of the same year there was no snow at Marietta. Snow seldom falls and only remains a very brief period. Of course this place is as yet little known, and yet it would seem to afford a place where those who wish to find a quiet home where the climate is pleasant, where the air is somewhat rare and pure, and where outdoor exercise can be taken, can live comfortably.

However, a large number of consumptives, when they go to a quiet health resort, suffer from homesickness, and become so despondent that they refuse to take the exercise so essential as a remedial measure in this disease. If they could find a locality where there is a combination of all the requisites of a perfect climate for consumptives, and also the opportunity to enjoy city life with all its attendant evidences of civilization, they could be placed under the ideal requirements for treatment. The only locality that I know of where there is the possibility of such a combination is

LOOKOUT MOUNTAIN, TENN.

This mountain has been memorable since Hooker sons living in the North. One point that is easily fought his battle on its summit in mid-air, but it is only recently that it has been thought to be desirable as a health resort. For this reason we cannot give any records of temperature, humidity, etc. But it This village is on the line of the Western and At- matters little, for temperature charts do not always Iantic Railroad, about twenty miles northwest of prove to be of much value. Again, we cannot give Atlanta and 120 southeast of Chattanooga, Tennes- extensive statistics as to the benefit to be derived see. Its altitude is 1,132 feet. About ten miles from a residence on this mountain, but we can enufrom the town is the Kennesaw Mountain, from whose merate the features which will commend themselves top Gen. Sherman made the famous signal to Corse: to all fair-minded physicians as those demanded in "Hold the fort; for I am coming." This mountain health resorts for consumptives.

This mountain has an altitude of from 1,500 to Marietta is delightful. For outdoor exercise one can 3,000 feet. The altitude is somewhat greater than take pleasant rambles, or can secure good livery at that of Marietta or Asheville. The advantage in this low figures and take the most delightful drives. If is that it insures a greater purity of the atmosphere the rural scenery becomes too monotonous one can and increases the activity of the respiratory functions. go to Atlanta, which is one of the most beautiful. As for the scenery that greets the eye of the observer cities in the South. But for amusements it will sel as he stands on this elevation, it is not in our power dom be necessary for the invalid to leave the village, to give you a word picture of it. Suffice it to say, for the proprietor of the Whitlock House, the health that to the lover of nature are presented views of enjoyments of his guests by excursions, drives, etc. rambles over the sides of the mountain disclose new The air is so fresh and invigorating that the temptal beauties in the landscape, and urge one to take the

about 30,000 inhabitants, having doubled its popula- O'Dwyer tubes, by making them with smaller heads. tion in the last twelve years. Northern enterprise has invaded the city, and the result is a grand development of her resources. Wealthy residents are building their suburban residences on Lookout Mountain, and the construction of the cable road was the outgrowth of the demand for building spots on the mountain. And yet this will prove a boon to sickly humanity. It enables the consumptive patients of the North, South, East and West to go to a place where are as nearly combined as it is possible on earth all the requisites for a climate in which con-trachea, by a rubber collar. (See cut No. 3.) sumptives should live. On Lookout Mountain cottages can be built in which patients can reside the year round. The cottage hospital plan secures to their inmates quiet, purity of air, such temperature in each room as each patient demands, home comforts, especially when the patient's family is along, and independence of action. By a residence on this mountain there are secured the following advantages:

- 1. Purity of air.
- 2. A proper elevation above the sea level.
- 3. Equable temperature, and air in motion, yet no glottis. (See cut No. 4.) During the act of deglutiwind storms.
 - 4. Sunshine.
- 5. Ontdoor exercise, pleasing landscape, home comforts and the advantage of close proximity to a

That these advantages can be secured is not merely an assertion, but fact that is susceptible of proof, and in due course of time the proof will be forthcoming.

MODIFIED INTUBATION INSTRUMENTS.

Exhibited to the Chicago Medical Society, February 7, 1887, BY F. E. WAXHAM, M.D., OF CHICAGO,

I wish to say a few words this evening in regard to intubation of the larynx in connection with the specimens and instruments I have to present. About thirty years ago a new operation was proposed as a substitute for tracheotomy, by M. Bouchut, of France, and so great was the opposition to this new operation, which was styled tubage of the larynx, that a committee headed by Trousseau, appointed by the Academy of Medicine, reported adversely in regard to it, and the operation was so deeply buried in oblivion, that early operators in this country were not even aware of the attempts and failure of Bouchut.

The most earnest advocates of intubation do not consider that the instruments are perfect, indeed the

even in winter, seldom is low as is evidenced by the operation is yet in its early infancy, and it may be years fact that during this winter there has been almost no before the method is fully and perfectly developed. One of the chief objections to the operation, indeed the Recently there has been completed a cable railroad only valid objection, is the difficulty of swallowing, winding up the mountain, thus connecting it with the danger caused by the falling of food and fluid into Chattanooga. The trip from the top of the mount the bronchial tubes through the canula, and the too tain to Chattanooga can be made in twenty-five min-frequent occurrence of broncho pneumonia. I would utes. This enables one to live on Lookout Mountain not exaggerate this danger, but certainly it is true and transact business, attend church or places of that many patients die of broncho-pneumonia from this source. To overcome this difficulty I have had Chattanooga is now a busy, enterprising city of Messrs. Charles Truax & Co., of this city, modify the

Cut No. 2.-Waxham's Modified Tube.

The tube is prevented from slipping into the

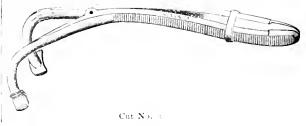

Cut No 3.

this rubber collar is attached a flap, or artificial epi-

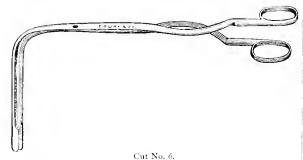

tion the larvnx rises and presses against the base of the tongue and the epiglottis, and the pressure of the epiglottis holds the rubber cap, or artificial epiglottis, over the aperture of the tube, thus preventing the dropping of solids into it, and as deglutition ceases, the larynx falls and the elasticity of the rubber throws it upwards. This rubber attachment does not entirely prevent the falling of liquids, of water particularly, into the tube, but it is of very great assistance in swallowing solids and semi-solids. I have used this modification in a number of cases with good results, and I have now a little patient convalescing from a desperate attack of diphtheritic croup, in which this modification was used.

I would also present a modification of the mouth gag. (See cut No. 5.) In the old gag the extremities are

liable to strike the shoulder, especially if the child is dinary pad of antiseptic gauze with tape attached to senot held well and is allowed to slip down in the lap of cure it in place. This pad should be passed over the the attendant, the extremity of the gag striking the mouth and nostrils and should be used by the physician shoulder and throwing it out of the mouth. This gag when inspecting the throat or when operating upon passes back of the head and we avoid the danger of a bad diphtheritic case. I believe it is a duty that the gag being displaced by pressure of the shoulder. every physician owes to himself, his family and friends, This gag was first suggested by Dr. McWilliams, of to take these precautions, especially in the treatment this city, and has been in the market for several of bad diphtheritic cases. months. There is still another danger that may follow the introduction of the tube, and that is the detachment of membrane below the tube, or the pushing of membrane down ahead of the tube when it is introduced. An accident of this nature occurred to me recently; a tube was passed down into the larynx and the respiration at once ceased, the child turned blue and seemed upon the point of death. was at once removed, but the respiration was only with the same result. It was again removed and the trachea forceps (see cut No. 6) that I have devised for

this purpose were introduced into the mouth and a mass of membrane, a perfect cast of the trachea and the two larger bronchial tubes, removed. After the removal of this cast the tube was again introduced, and respiration was easy. Without these forceps an immediate tracheotomy would have been necessary.

In this connection I present to the Society a membranous cast from the trachea larynx and bronchial tubes of the late Dr. Newton. This specimen is remarkable not only for its thickness and its extent but for the rapidity of its growth; it was produced within three or four days after the invasion of the larynx. The fate of Dr. Newton, whose early death we all regret most sincerely, teaches us a sad lesson; it teaches us the danger that besets the faithful physician, and the necessity of taking every possible precaution against the contraction of this hydra headed monster, this justly dreaded disease.

To those practising intubation 1 would advise that an ordinary rubber cot with the end cut off should be slipped over the forefinger, and then during the operation, if the gag is displaced, the finger is protected; as an additional protection, it will be well for the operator to use a respirator, (see cut No. 7.) an or-

NEURITIS PLANTARIS; A CLINICAL RECORD.

Read before the St. Louis Medical Society, March 5, 1887. BY C. H. HUGHES, M.D.,

OF ST. LOUIS, MO.

This rare, painful and formidable malady of the slightly improved and the tube was again introduced, terminal distributions of the two popliteal nerves in the foot is worthy of the physician's especial study. It comes on as the sequel, usually, of a low form of blood-depraying fever, like typhoid or protracted malarial, with typhoid like depression, or in the latter stages of phthisis; but it may be the sequel of an exhausting, long-continued rheumatism, or possibly of a badly-managed or neglected and chronic gonorrhea, as Ross asserts, though I have never seen this as a result of that disease. It appeared as a conjoint symptom in some of the cases of caisson disease at the time of the building of the St. Louis Bridge, and I have seen it follow upon a residence in the high altitudes of Colorado, and an attack of the so-called mountain fever of that region. It comes upon a nervous organism, shattered and tremulous, and choreic, and the painful paroxysms are agonizing. The patient cries out with pain, and often cannot rest at night, even after prolonged wakefulness, without powerful anodynes. The slightest touch, such as the application of local anodynes with the hair pencil, to the painful parts, often cannot comfortably be borne. A peculiar burning sensation, without thermometric evidence accompanies the pain. The pain is usually localized in the balls and the tips of the three toes supplied by the internal plantar nerve, and in the heel and plantar arch of the foot, but sometimes implicates also the two smaller toes, which are supplied from the external branch of the plantar nerve, the fifth toe being supplied exclusively by the external plantar, while a filament from the internal joins with the external, in giving the fourth its æsthesiodic supply.

Misleading vasomotor disturbances, suggesting erysipelas, or incubating abscess, are sometimes associated with this form of neuralgia, but in those intensely severe cases which have fallen under my observation, the feet have been pale and dry. A sour sweat has been mentioned as associated with some quite similar cases described by Ross. I have never observed this.

Poulticing does not help these cases, and the metatarsal and tarsal swelling, and fluctuation which usually follows this procedure, sometimes excites the fear of forming abscesses, but this soon subsides if the poultices are not renewed. Intense dry heat or a draft of cold air alike painful to the patient, and

to 150° is often a source of comfort to the patient. left his foot, Ether and Goulard's extract give a little temporary better but is sometimes too burning. A paint of tember 23. He had lost much of his hair and his equal parts of chloral and camphor with morphia or nails were changed to a dirty brown color. The belladonna is pretty well borne in some cases, and movements of the upper and lower extremities were gives considerable, and sometimes complete local tremulous and choreic on attempting exertion. The relief for a time. Cocaine, likewise, but is usually paroxysms of pain in the feet recurred every few too painful when first applied. On October 20, the patient returned for treatment,

A case came under my care last June not preborne. The temperature of the foot was not above upon. This trouble was followed, on the 1st of July, The patellar tendon reflex and tendo- with a dysentery which lasted till about the middle

Dr. Elsworth Smith, of this city, succeeded me in No effort at eliciting the reflex phenomena was at-charge of this case on the 24th of July (when I took tempted till after the hyperalgesia and hyperæsthesia my vacation), and the patient, by our joint advice, went East, to the sea shore. After her return, in Without fever and without evident organic lesion September, the foot trouble reappeared, and was

much like one of Wier Mitchell's typical cases of neuralgia of central origin of the common terminal erythemomegalalgia. The skin in this case was red branches of a certain nerve-trunk. This gives it the over a certain area of the sole of the foot and the character of peripheral neuritis rather than of simple great toe, and the two adjoining lesser toes, and neuralgia. But why neuritis plantaris should select peeled off. The nails were not discolored, but the the internal plantar nerve about the point of its bifurball and tips of the great and adjoining toes were in-cation, and at its distribution in the toes is only tensely painful. An ointment of acetate of lead conjectural. It may be due to the fact, that it is and belladonna was however well borne, and this larger than the external, has more to do in the moveand quinine and belladonna internally gave relief. ments of the foot and toes, and is more pressed upon The patient is now (November 25) quite well for one in standing and walking than its outside neural of her age and other local infirmities, and has neighbor. gained in flesh, appetite, sleep and strength.

they may also precede, as well as follow poison or though by no means in all. depravity of blood, and the effect is not always, nor do I believe ever, altogether spent on the peripheral nerves, though it is there usually most apparent. In the case first above described, there was pain in the sciatic on pressure, near its point of emergence, from the pelvis under the pyriformis muscle, and lower down between the trochanter major and the complained of about the waist, even after the pain had left the foot, so that what Ross says of this disease, viz.. that it is sometimes progressive, and in its later stages may be associated with evidences of spinal disease, such as girdle pains and partial paralysis, muscular atrophy is not a future impossibility with our patient, though we shall endeavor by judicious management of the case, if permitted, to avoid so dire a result.

tion of neuralgia trifacialis and other forms of transi- ated. Suppuration followed this tapping, and thirteen bifurcate from the posterior tibial, but is exclusively puncture for eleven days, than a hydatid sac partly confined in all the cases I have seen to the digital forced its way out and was partly extracted through branches of the internal plantar, extending no this opening. The sac was greyish in color, transfurther outward than the distribution of the nerve to lucent, and elastic, and its sunken condition would the inner aspect of the ball of the fourth toe, and the about fill an egg cup. The swelling gradually subtoes all seem to be more or less conjointly rather sided, the sinus closed, and the patient left cured.than alternately painful, as is usually the case in true Lancet, Jan. 29, 1887.

Ross, we think, has justly criticised the name ery-There was no persisting accelerated heart action themomegalalgia, given by Mitchell to these cases, in this case. While I regard these cases as all be- "inasmuch as the vasomotor disorders are preceded longing to the same category of peripheral nerve and accompanied by severe paroxysms of pain," irritability from inflammatory states of the nerves or though the name given by Mitchell is certainly very their sheaths, or conditions approximating inflamma- descriptive of his own cases, as they all had erythema tion and due to blood states, as other forms of neural as well as intense pain, and the flushing over the pain and nerve-sheath inflammation after fevers, painful area is quite characteristic in many cases,

MEDICAL PROGRESS.

HYDATID CYST OF THE SCROTUM.—A case of ischium. There was also some sense of constriction hydatid of the scrotum came under the care of Mr. PHILIP E. MUSKETT in the Sydney Hospital during the course of last summer, and as this is an example of a very rare condition a brief note will be of interest. The patient, aged 25, had been in Australia since he was 3 years old, and in a sheep district where the water was very bad for four years before the swelling appeared; this was first noticed eight years before he came under treatment. During that time it had been tapped twice, and on the second The efforts of pathologists have, of late, been in occasion also injected with iodine. When admitted the direction of establishing them as febrile sequelæ, to the hospital "there was an intra-scrotal tumor, as they most usually, but not invariably are, as MM. about the size of a large emu egg, on the right side. THE TREATMENT OF PUERPERAL CONVULSIONS.

be administered hypodermically to some, if not to the patients, but renders them brighter." all, patients with acute uraemia, without endangering Leading obstetricians seem to be agreed that phine so administered is first to arrest muscular sions, some placing it above all others as a continuspasms by counteracting the effect of the uraemic ous remedy, others using it to control convulsions poison on the nerve-centres; second, to establish until other drugs begin to act. While formerly it profuse diaphoresis; third, to facilitate the action of was recommended that it be used in full anæsthetic cathartics, and diuretics, especially the diuretic ac- doses, so as to paralyze the motor centres, it seems tion of digitalis." We know that in puerperal con- to be agreed, on this side the Atlantic at least, that vulsions, as in uræmic convulsions of nephritis, the it should not be pushed except when labor is nearly functions of elimination are held in check; and at a close; except in this case "it is advisable to reunder such circumstances morphine may be admin strict the chloroform to the pains, and to the restlessistered with the view of "holding the patient until ness which is often the preliminary to a fresh seizure." the normal eliminating process shall be re-established." It seems to be more widely and exclusively used in

In a recent communication Dr. JOSEPH D. EG-Journal of the American Medical Association. GLESTON, of Worsham, Va., writes: "I have used morphine in these cases for sixteen years, and I began its use on account of its antispasmodic effect. I was afraid of chloroform because it caused too much coma, and had tried chloral, veratrum viride, and other drugs in place of venesection, which reduced the patient so much that I was anxious to find something that would lessen the use of the lancet. By using morphine I found that I could dispense with chloroform altogether, but not with chloral, the effect of which was more lasting, and the drug could be continued indefinitely without injury to the patient. I have not had a case of puerperal convulsions for five years; and this I attribute to the use of bitartrate of potash as soon as there is the slightest swelling of the feet or legs of a pregnant woman. I have yet to find one show the slightest symptom of uræmia after beginning its use, two teaspoonsful every morning, in water. If, in spite of this, amaurosis occur, I order chloral in 10 grain doses three to six times a Within the past six months several papers on the day, with very decided effect. In an experience of treatment of puerperal convulsions have appeared thirty-six years (thirty cases with thirty recoveries) I in different journals, and among the various measures have found nothing equal to morphine and chloral, and remedies suggested and praised for treating this by which we can treat the cases without the loss of affection, we have seen no mention of one of the blood, and consequently with better and easier aftermost powerful means for controlling these convul- recovery. Morphine does not increase coma when sions—hypodermatic injections of morphine. It is used during convulsions; it is easy to see whether now almost twenty years since Professor Loomis the pupils are inordinately contracted. So far from began the use of morphine subcutaneously to control the coma being increased it will be found that in uræmic convulsions. We need not stop here to dis thirty minutes, at farthest, it is lessened, and in many cuss the pathology of puerperal convulsions, and to cases the patient fairly on the road to recovery. inquire as to the difference between them and the Should I have a case of puerperal convulsions toconvulsions of ordinary nephritis. Loomis makes day, the first thing I would do would be to use a comno distinction between them when he writes: "From manding dose of morphine and atropia hypodermatthe histories of quite a large number of puerperal ically, and give bromidia or chloral; and if this did and non puerperal cases of acute uremia, in which not act promptly I would bleed. One would be surmorphine was successfully used, I have reached the prised to see the effect of morphine in these casesfollowing conclusions: First. That morphine can as if bringing the dead to life. SOCIETY PROCEEDINGS.

CHICAGO MEDICAL SOCIETY.

Stated Meeting, February 7, 1887. THE PRESIDENT, EDMUND J. DOERING, M.D., IN THE CHAIR.

Dr. W. E. QUINE, Chanman of the Committee appointed to convey to N. S. Davis, M.D., L.L.D., a formal expression of the Society's estimate of his labors and character, prefaced the presentation of the report, by a few well chosen words of congratulation to Dr. Davis on his arrival at the fittieth anniversary of the date on which he received his diplomato practice medicine. The report of the Committee, which had been engrossed on parchment, was then read and presented to Dr. Davis, who responded in a feeling manner.

Dr. J. A. Robison read a paper on THE CLIMATIC TREATMENT OF DISEASE. (See page 289.) Dr. F. E. WAXHAM exhibited

MODIFIED INTUBATION INSTRUMENTS.

I have fer it, has an advantage, namely, that when it is so always made it a practice to introduce the tube with placed, the patient's ability to swallow is appreciably the bevelled portion directed forwards and the progreater than when it is inserted as intended by Dr. jecting shoulder backwards, and I think this has O'Dwyer. The anatomist, Professor Hoadley, pre-been one reason of my success. To me it seems a fers this reversed position. He has now introduced reasonable method of placing the tube because, if the tube in this manner in eight cases, and in seven the higher portion is directed backwards the epiglottis of these, the patients directly after the operation, can more perfectly close over the aperture of the could swallow fluids without the least difficulty. Dr. tube than if the high portion is introduced forwards. Hoadley maintains that the flange of the tube as Little or no difficulty is ordinarily experienced by placed by him deeply within the vestibule of the the expert in removing the tube. It has been relarynx, in no wise interferes with the functions of the moved over and over again in two seconds, and yet epiglottis, or the aryepiglottic folds. Confusion in occasionally, if the tube becomes turned in the regard to the proper position of the tube, has arisen larynx, or if from the small size of the tube it sinks here from earlier cuts of the instruments accompany- to the bottom of the larynx, it becomes difficult even ing some of the cases; these erroneously represented for the expert to extract the tube, and in such a case the tube placed with its longer margin forward. I de- after two or three careful attempts, we should give sire to say a word in regard to feeding these pa- the child an anæsthetic so as to have it entirely quiet tients. There are reasons for believing, that by the while the extractor is passed into the tube. In exuse of a French condé catheter of proper size, in-tracting the tube it is best to place the finger over troduced some distance into the gullet through the the base of the tongue, when the child will gag and nasal cavity, thorough alimentation could be secured the tube will rise to the finger and it can be caught without distressing the child, or, a suitable stomach with the extractor. tube, might be introduced through a stomach tube director without greatly distressing the patient. Stress might be properly laid upon the fact that pultaceous food, as bread soaked in milk, is swallowed more readily than water, or fluid nutriment.

Dr. Charles Warrington Earle said: I think Dr. Waxham, who is certainly the most successful in being in order,

this operation, should warn the general practitioner who has had little experience, against trying this operation without some one standing at his elbow to show him just how to perform it. There are few who do it well, and I know of excellent surgeons in this city who may be trusted in everything else, but who have tried to do this operation and signally failed. And, although Dr. Waxham talks as it it was very easy, I think no person should try the operation for the first time without having some one by him who is particularly skilled. I remember very well trying to perform the operation, and I had Dr. Waxham right there. I tried my best to introduce the tube but could not, and Dr. Waxham took the instrument out of my hands and did it in two seconds. I think he should not try to make it appear so easy.

Dr. Waxham, in closing the discussion, said: I would say a few words in regard to feeding patients. I think one of the secrets of success is proper feeding, and the attending physician should superintend the feeding of the child. He may tell the people to feed it bread and milk, or semi-solids, and if he investigates the matter he will find they are giving it half a teaspoon of milk with a little bread, and the milk trickles into the trachea and the bread is rejected. If they are told to make a custard they make it so Dr. John Bartlett said: Dr. Waxham has given soft and fluid that it will trickle into the trachea. It

Stated Meeting, February 21, 1887.

THE PRESIDENT IN THE CHAIR. The discussion of Dr. J. A. Robison's paper on CLIMATIC TREATMENT OF DISEASE

open the discussion of the treatment by climate of her recovery seemed assured, but on physical explorconsumption, one of the most frequent and fatal dis-ation of her lungs I was surprised to find that the eases that afflict our race. Statisticians tell us that area of consolidation had extended until it involved more than three million persons die annually of this almost the half of the right lung. She went to Dendisease. Dr. G. B. Wood, in his "Practice of Med- ver again, but did not improve much. She remained icine," states that north of the tropics one sixth of there about two months and returned with the exudall deaths are caused by this disease. And upon con-ation rapidly breaking down, and only lived two or sulting Zeimssen I find that the author of the article three weeks after her return home. I have observed on consumption makes the statement that two-sev- this fact: that while the patients seem to improve in enths of all the deaths in the world are caused by their general health, the exudate increases rapidly, pulmonary tuberculosis. Since this disease is so gen- and if softening occurs it takes place also very raperal, and since treatment by medicine does not ac-idly. This is probably due to the high altitude. I complish as much as hygiene, which includes climatic have also observed that in the high altitudes patreatment, it is very important that we discuss the tients who have a tendency toward hæmorrhages are subject.

appropriate climate, which were adopted in the paper, Fe and Albuquerque. are correct. From my study and tobservation of the speak more particularly of different localities that are that I stopped sending any patients to Texas. known as health resorts, and will state what facts my experience and study has taught me concerning these ered, I think the best climate and opportunities for

Twenty years ago I began the study of the Colorado sumption to Long Valley, California, all of whom re-

Dr. Joseph P. Ross said: I am called upon to eleven pounds in weight. To all outward appearance apt to be unfavorably affected in this way. In the excellent paper read by Dr. Robison at the fore, in the later stages of tuberculosis, the high last meeting, he quoted the opinions of three leading mountains of Colorado and New Mexico are objecmedical men with reference to the kind of climate tionable. For this reason I have carefully selected which is appropriate for the treatment of consump- all cases that I have advised to go to Denver, Colortion, and I think their views with reference to the ado Springs, Pueblo, Raton Pass, Las Vegas, Santa

I next selected San Antonio, Texas, as a health effects of various climates upon tubercular patients, resort, and sent patients there for a few winters. I believe that, although you cannot say any particu. During the first winter some seemed to improve, but lar climate is suitable for every case, you can say that a large number of them complained that the sudden for cases in general the air should be pure and dry, cold winds from the north, or northers, as they are should be neither too hot or cold, should not be variable, and should be somewhat rarefied; for instance, monia. In the spring or summer there is a great such an air as would exist at an altitude of from 1,000 deal of malaria. But barring the northers and malato 3.000 feet above the sea level, and lastly, the air ria, a great many cases do very well there, and durshould be invigorating, because of its containing an ing the months of December and January, I believe additional element, probably ozone. It may be that it is a very good climate for consumptives. But durthis invigorating quality is due to an electrical condi- ing the summer months the heat has too- depressing tion of the air, but I think it is more likely due to an influence on the patients. While I believe that ozone. I waive the discussion of each of these ele- in January the patients were a little better in San ments appropriate to a good atmosphere, but will Antonio than in Chicago, still they did so poorly

I sent many to California, and, all things considtreating this disease are found in California. I sent a In the first place, I will briefly refer to Colorado. brother, a son, and a servant boy with advanced conclimate. You will remember that at that time the covered. I had quite a number of patients who recoveyes of the medical profession were turned to this ered in the valley north of Virginia City, just below the region as offering the best promises for a good cli. Summit Range. And a number of my patients remate for tubercular patients. I thought that in Col-gained their health on the other side of the range, in orado we have a climate where there is a pure, the foot hills of the Sacramento valley. With reference bracing air, with an altitude high enough to secure to Southern California, probably for two months of rarefaction of the air sufficient to invigorate the res- the year it would be desirable to send patients down piratory functions. I sent a large number of patients to Los Angeles, Riverside or San Diego, but taking there, and the following is an almost typical history that climate all the year around it is not the place, of the course many of these cases took: Mrs. H. because the air does not contain something that had been ailing six weeks. Her symptoms were should make it essentially invigorating; it is not light cough, profuse expectoration, fever and night sweats, enough, and seems to lack ozone. I think patients Physical exploration revealed a consolidation of a affected with ordinary catarrh will do well there, but limited area in the apex of the right lung, supposed consumptive patients do not improve in Southern to be tubercular. This exudation did not extend California all the year round. If one could live in much below the lower border of the second rib, the southern climate for two months in the year, and Being in affluent circumstances, she was sent to Den-then go up into the Sacramei to valley, where you ver, where she was surrounded by every comfort and can find almost any altitude, I think probably it luxury. She embraced every opportunity to improve would then be the best climate for cases of consumpher health. In two months she returned to Chicago, tion in general on the continent. One objection to her strength having improved, and having gained sending patients there is the distance from Chicago.

Florida, and after going all over and investigating 3,000 feet above the sea level you have a good clithese regions, but Florida more especially, I hold the mate, and it is near home, and so convenient that if same view in regard to that climate that I obtained anything should happen friends can go to the patient, when I was there last year. I visited Palatka, on or he can return home, in a few hours, which is anthe St. Johns River, and called on Judge B. and other reason why we should think favorably of this asked him what kind of a climate for consumption latitude. During the past fifteen years I have had they have in Florida. "Well," he said, "I will ex- considerable experience in sending patients to these press my views candidly. If you want to send your regions, and they return as much improved as I ever consumptive patients down from Chicago to have had them return from any other point on the contithem put in the ground, send them along." I think nent. I have had patients go to Chattanooga when the climate of Florida is a failure for the treatment they were not able to climb Lookout Mountain, and of consumption, for this reason: patients go there they would come back wonderfully improved. I felt having a cough, being debilitated by disease, and the deep regret four years ago at sending a lady down air is balmy, and they say, what a beautiful air. They there, for I did not believe she would ever return do not cough so much, but they sit around and take alive. I knew she could not live here three weeks, no exercise, for there is nothing to cause them to having all the symptoms of advanced tubercular take active exercise. There is something lacking in trouble, with almost complete consolidation of the the air; it does not brace one up, and I never saw a lung, but in four months she came back almost cured, patient there that improved the least from day to day, and to day I met her on the street, and she is to all The atmosphere is warm and moist, and very de-, appearances robust and healthy. The question comes

pressing, while malaria abounds.

Robison, I have investigated the climate of the balf to go there; Marietta takes thirty-two or thirtymountains of Tennessee, Georgia and North Caro- three hours to reach; while it takes twenty-one hours lina, and have been to the places mentioned in the to go to Chattanooga. I think, as Chattanooga is a paper: Asheville, N. C., Marietta, Ga., and Chatta-little nearer home, it would be desirable to try that nooga, Tenn., and I fully agree with the remarks point, and if that does not suit the patient he can made by the author. I think the climate of these move on to Marietta. On Lookout Mountain the regions is suitable for the treatment of consumption, scenery is perfectly grand and beautiful, and lends I think it is well for us to consider the favorable fea- an interest to a residence on the mountain. The tures of this mountainous region of Tennessee, Geor-scenery is varied from every point of observation. gia and North Carolina, which is called, and I think As they have a cable railroad on the mountain, if correctly, the Switzerland of America. In the first you get tired you can run down into Chattanooga, a place, let us contrast the climate of that region with town of 30,000 inhabitants (and in a few years they ours at the time of year when our climate is bad. It will have 50,000), in a few minutes. is in the spring from the January thaw until June that our climate is bad; the latter part of winter and wish to say that Mr. and Mrs. Carter, of Chicago, spring. Now, it is a fact that at an altitude of 6,000 have rented a most beautiful home on Lookout feet above the sea level, as at Denver and Colorado Mountain and will run it as a health resort. They Springs, the air is too cold, and when we have bad opened our County Hospital in this city twenty five weather here you will find bad weather in Colorado, years ago and were managing it beautifully until the extending from the January thaw until near June. During these months when our climate is bad, you but they demonstrated their ability to manage a hosconsider the question of sending patients away from pital. They have accommodations for entertaining Chicago. In Great Britain and the north of Europe about 200 guests, and I think it is the best place to they consider that the bad time of the year is from regain health I have ever known. If the patients January to June, and they send patients down where should tire of Lookout Mountain House, kept by the Alps dip into the Mediterranean Sea and where Mr. Carter, they can go to Marietta in a few hours, they find the climate mild, about the same conditions and here is a pleasant health resort. I never passed of climate that we have down South. All the rest a more pleasant week than at the Whitlock House in of the year we have a good climate; in fall, summer Marietta. Mr. and Mrs. Whitlock are the most and early winter, the Chicago climate is not bad, it genial host and hostess I ever met. They look careis only in the spring, and then you want to consider fully after the interests of their guests and provide where you should send your patients. You might them with every comfort. send them to Texas, and it may be that in January they might be a little better there, but for the whole My reasons for recommending the South as a place time it does not seem to me they have a climate with to send consumptives are: which they succeed in curing patients. You might send them so far away, the other localities mentioned able in the South. in this paper are good places. I endorse what was! said about the favorable climate in the South. I Asheville to Chicago and the North. The trip can have spent spring, summer and winter months down be made in a few hours.

Afterwards I made a study of the Gulf coast and there, and I find that at an altitude of from 2,000 to up with reference to the most desirable points. Ashe-With reference to the regions mentioned by Dr. ville is in North Carolina, and it takes a day and a

We characteristic. In removing a patient who has tuare all aware of the fact that there is some truth in the berculosis from the surroundings of his home we are old saying: "Laugh and get fat." It is an impossibile doing the best possible for that patient, from a moral

DR. R. G. Bogue said: Some years ago it was I care not how good the climate. And here comes my fortune to spend a few years in the South, the one of the greatest difficulties which we have to congreater portion of them in the mountain regions of tend against in all diseases. Let us imagine for a Tennessee, Northern Alabama and Northern Geormoment the head of a dependent family who fears gia; all of one winter, about six months, in Chattaconsumption. The physician advises him to leave nooga. I can bear testimony to the wholesomeness home for a more salubrious climate, and under the of the entire region for the greater part of the year, pressure of circumstances he takes his departure, and in the mountain regions for all of the year; in It may be that he begins to think as soon as he has the valleys there are about two months in the sumbought his ticket: there is \$25 or \$100 that my mer season when malaria is quite prevalent, but up children will need. This is a big load. He thinks in the mountains it is eminently a healthy country. he is going to be gone for a month or two, and he The air is pure, the water is good, the scenery is estimates what his services would be worth to his magnificent; there is everything to entertain and family, and if anything should happen to him his amuse one so far as scenery is concerned. The rewidow will need it; and this is another big load, gion of Chattanooga is peculiar and delightful from We can readily see that it is impossible for his frail the variety of the mountain and valley scenery. The frame to bear up under these burdens. It is prob- entire year, or very nearly so, it is practicable for able that there would be more cheerfulness at home people to be out of doors. During the latter part of than away among strangers, no matter how desirable December, all of January and the early part of Febthese places may seem. These things must be taken ruary, the temperature is subject to considerable into consideration. I have thought, for a number of variation; it is reasonably cold and there are some years, that the benefit of our watering places was not storms, but after the middle of February, with the from the water, but because the patient leaves home, exception of now and then a short storm, the climate leaves business cares and has a gay, good time. He is delightful, extending thus through the whole sumgoes to Saratoga with plenty of money in his pocket, mer. The altitude in the mountain region is such as enjoys the fine music, enters into the gaieties of the to render the summer not oppressive. I fancy that ball and the festivities of the occasion, light as a for the colder and stormy portion of the winter the feather, buoyant as the mountain air. Sadness of region south of Atlanta might be better for conheart has melted away, that patient can "laugh and sumptive patients than north of the Atlanta, although get fat." There is something here for us to study, personally I do not know as I was not so far south. the tranquility and peace of mind so that nutrition. There is Macon, and that part of Georgia fifty miles north of the coast, and extending through Georgia The idea is advanced in the paper that in good en and Alabama to the region of Mobile. Quite early vironments bacteria cannot thrive. If they cannot in the spring one can come northward, coming north thrive they are not able to do their mischief. There of that range of mountains into the valley this side may be something in this which we do not under- of the Atlanta, to Marietta, and find a delightful stand. We do not believe that laughter will ever get spring climate, with a great deal of sunshine, and a rid of a tapeworm; we do not believe that cheerful forest filled with bloom for two months in the spring, society and good music will east out or put a check and everything, as far as climate and scenery are upon the ravages of trichina, but we are compelled concerned, to delight even a sick person. There is by force of circumstances to acknowledge the truth much to recommend the region of Chattanooga to fulness of the assertion that good environments will invalids, and if they are not satisfied with Chatcheck, if not destroy, the influence of microbes, and tanooga or the vicinity, there are other points, Mariif we are convinced that microbes are really the cause etta, Atlanta, and north of the Tennessee river, the of tuberculosis, then we want to place the patient in region of Huntsville, and north from that as far as

DR. WM. T. BELFIELD presented a

PROSTATIC MYOMA---A SO-CALLED "MIDDLE LOBE" OF THE HYPERTROPHIED PROSTATE—REMOVED BY SUPKA PUBIC PROSTATOTOMY.

years experienced difficulty in urination, and for his catheter. There was found symmetrical enlarge-ture, and still pulsates with the brain. ment of the prostate per rectum, dilatation and catarrh of the bladder, and an impediment at the bladder neck to the entrance of rigid instruments. Exploration of the bladder by supra pubic incision revealed a solid prostatic outgrowth, or "middle lobe," as large as a hazel nut and of flattened pearshape, springing by a short, narrow pedicle from the vesical orifice. The pedicle was twisted off with forceps and the growth removed. Recovery was uninterrupted, the fistula closing entirely on the seventeenth day. Patient has since urinated freely without a catheter, and can now almost completely empty the bladder; the cystitis has subsided.

Dr. Belfield also presented specimens of

MUCOUS CASTS FROM A CASE OF MEMBRANOUS ENTERITIS.

The patient was a nervous, rather hysterical lady about 35 years of age, who for several years had at intervals suffered from severe intestinal colics, followed in a day or two by diarrheea with the expulsion of these casts; for several days thereafter much soreness and tenderness of the abdomen was experienced. The casts appear under the microscope as amorphous pseudo membrane enclosing cast off epithelial cells. They are said by DaCosta to give the chemical reactions of mucin. This patient improved materially under small doses of bichloride of mercury and pills of iron, arsenic and strychnine.

Dr. Belfield also exhibited a

FOREIGN BODY FROM THE BLADDER;

a roll of chewing gum, two inches long, partially encrusted with urinary salts, which had been removed from the bladder of a young man by Dr. T. W. Mil-The patient, suspecting he had a stricture, had explored his urethra with a well-masticated roll of chewing gum stuck upon the end of a broom straw. When the straw was withdrawn the gum had disappeared. Acute cystitis ensued. Attempts to detect and extract the gum with a small lithotrite having failed, perincal urethrotomy was performed and the gum extracted by the finger. Patient entirely recovered in two weeks.

Dr. Belfield also presented a

may be in a mild invigorating temperature, really all depth of over an inch. On admission to the County the year in the space of a couple of hundred miles. Hospital over a teaspoonful of brain substance was found among the hair; the scalp and dura mater were badly lacerated. The fragments of bone were removed, the wounds in the brain substance cleansed and drained, and the scalp wound sewed up. After the fourth day the temperature remained normal; The patient, a man 73 years old, had for several the wound was entirely healed in a month, the dressing having been changed four times during that penearly a year had been practically dependent upon riod. The scalp is depressed over the seat of frac-

Dr. Belfield also presented a specimen of

INTESTINE COVERED WITH MILIARY TUBERCLES; DEATH FROM MILIARY MENINGITIS.

This specimen is a piece of intestine the peritoneal covering of which is full of miliary tubercles. This case was a girl about twenty years old, who had always had excellent health. Three sisters are still living, and neither they nor the parents, nor any of the relatives so far as known, have ever shown symptoms of tuberculosis. The present generation are examples of perfect health, and this girl was in many respects apparently the healthiest of the lot. Until five days before her death her health was as usual; then she complained of feeling ill one evening; her head ached; she vomited without apparent cause; she lay down, drank a cup of tea, and was all right. The same thing happened the next day, and she complained of extreme headache. On the third day, with the exception of severe headache and vomiting without cause, she maintained her usual health. The evening before her death she was at the theatre, and came home about 11 o'clock, going to bed with one of her sisters. During the night the sister was several times awakened by the extraordinary breathing of the patient, which was very hard and loud. She shook her and the abnormal breathing ceased. In the morning it was found impossible to wake this girl; she was breathing very deeply and slowly and could not be roused. Physicians were summoned and all of them pronounced it a case of opium poisoning. The symptoms as related to me were stertorous breathing, sometimes as slow as four or five per minute, contracted pupils, a suggestion of strabismus, and rather warm surface. The pulse was remarkably good, about 80, similar to the pulse of a healthy person; the skin was not moist and clammy. The physicians instituted the usual measures for opium poisoning; they gave mustard at once, and as soon as a tube could be procured pumped out the stomach. They injected minute doses of atropine hypodermically, the patient receiving about a fortieth of a grain in three injections. The breathing improved very much after these injections, coming up to twelve and fitteen per minute; the pulse also quickened; suddenly the pulse flickered and went

Dr. D. S. Lamb presented specimens of CANCER OF THE SUPRARENAL CAPSULES AND ADDISON'S DISEASE.

which is so usually found in Addison's disease.

Prentiss and Frank Baker; in which I made the could take but little nourishment, had severe pain in necroscopy assisted by Dr. Baker. The patient, epigastrium and constant tired feeling; sleeplessness; Mrs. Rosina M., white, age 61, died September 22, pulse small and weak. Died April 15. 1882. The following lesions were noted at the p. m. thighs; upper limbs emaciated; lower limbs mark- many black spots from one eighth to one fourth of an edly adematous. Cicatrices of pregnancy on ab- inch in diameter, some slightly elevated, some of a normal except a small cicatrix at apex of right lung. limbs of a lighter color than the face, and showed a Abdomen contained many soft white flakes of lymph-few similar black spots. Head not examined. Abundand yellowish serum. Greater omentum contracted, ance of fat in subcutaneous connective tissue: one thickened and contained cancer nodules. Stomach inch thick over the abdomen. Right lung collapsed, contracted to six inches in length and three in congested posteriorly, contained several calcareous breadth; middle portion adherent to adjacent vis-deposits; firm old pleuritic adhesions. Left lung cera and walls occupied by a thick hard cancerous similar to right; calcareous deposits more numerous mass, deeply ulcerated; the ulcerated surface was and larger; adhesions more extensive. Heart flabby,

them there were found numerous miliary tubercles, part, showed several cancer nodules. Gall bladder On opening the abdominal cavity the intestine bulged much distended with bile. Spleen small, soft, firmly out, its surface thickly studded with miliary tuber- adherent to adjacent organs, and contained one hard cles; there was extreme tuberculosis of the pereto-cancer nodule. Pancreas and kidneys normal. Suneum and the mesenteric glands were large and prarenal capsules much enlarged and converted into cheesy; there was a ruptured cyst of the right ovary, a cancerous mass. Ovaries atrophied and underabout as large as a fist. That the rupture was ante-going colloid degeneration. Lumbar and left iliac mortem was evident from the fact that the inner sur- glands enlarged and cancerous. Microscopical exface of the cyst was intensely congested; there was aminations of the several organs by Dr. J. C.

Case 2.-Cancer.-Woman, age 35, was five days been taken, yet it seems probable, when we consider in Freedmans Hospital, in this city, where she died. that the pulse was natural, that the surface was not She was anæmic, constipated, urine albuminous; and cool and clammy, and that there was a tendency to had convulsiors. She was attended by Dr. F. J. strabismus, that her death resulted from the tuber. Shadd, of the hospital, who made the necroscopy culosis, perhaps rupture of the cyst. There was no and contributed the specimen. This consists of the morphine found anywhere around, and her general right kidney which is normal; and its suprarenal disposition and circumstances were such as to forbid capsule, which is converted into a soft cancerous the conception by her friends that she could have mass, 4 inches by 3.5 by 3 and was adherent to liver. taken poison. The case seems to have been another Renal vein and inferior vena cava were occupied by instance of sudden coma incident to tubercular me-blood clots, which were closely adherent to the ningitis. It is of extreme interest as showing how walls; in some places the inner coat was thickinsidious miliary tuberculosis of the serous mem- ened as by incipient cancerous growth. Left kidney

Case 3.—Addison's Disease.—Attended by Dr. J. tailoress. First noticed a discoloration around her mouth three years before death, that is, in 1872. This extended but little until the summer of 1874; afterwards it spread rapidly until the whole body was affected. Black spots appeared in January, 1875. The patient's previous health had been pretty good except that her monthly periods had for a long time occurred every three weeks, and were sometimes excessive in quantity. She had never been pregnant, though married seven or eight years. About the beginning of the winter of 1874-5, she began to complain of feeling week, could not work regularly, and working was followed by prostration. After January t, she gave up working altogether. Her feet and legs became swollen; she had constant pain in her The following three cases are reported to illustrate back and left side, and had dyspinea on going up cancer of the suprarenal capsule contrasted with stairs. Dr. Voung first saw her in March, 1875. that lesion of the capsule, viz.: cheesy degeneration, On the 25th of that month, feecial crysipelas set in and lasted six days. April 5, there was uncontrolla-Case 1.—General Cancer, attended by Drs. D. W. ble nausea and vomiting, which continued. She

I made the necroscopy and found lesions as follows: Petechiae on anterior and inner surfaces of Face a faint yellowish-brown color, and showed Head not examined. Thoracic viscera uniform tint, others darkest in the centre: body and shreddy, and dark from hæmorrhage. Intestines contained a few small clots and a little blood. Large

calcareous mass in a greater omentum. Stomach The women's occupation, tailore's, suggests no exand intestines normal. Liver extended up to third planation. The theory of Greenhow, that the disrib, was dark-red and somewhat flabby. Gall bladder ease is most often found in those who do severe full of dark green bile. Spleen normal. Kidneys manual labor, of course, is not supported. His dark. Suprarenal capsules contained cheesy masses, further theory, that the cause may be found in the larger in the right. Firm adhesions of omentum, history of some strain or other injury, especially in liver and spleen to abdominal wall. Posterior ad- women, is not confirmed, simply because it is not hesions of uterus. as they are also called, the "adrenals" are subject, tubercular; and in this case calcareous deposits are mainly secondary to similar lesions elsewhere; were found in both lungs and in omentum, suggest-sometimes by extension, by contiguity at others, ing obsolete tubercule. Attention was not drawn to by infection from distant organs. Thus we have the semilunar ganglia by any peculiarity of appearlardaceous degeneration, cheesy degeneration, tu- ance; this is the more to be regretted in view of the berculosis, cancer, embolism, abscess.

symptoms is the cheesy degeneration. It is gener any way due to them. ally admitted that the disease known as Addison's disease is intimately related to this form of degeneration of the suprarenal capsules. The exceptions

are very few in number.

In the first case, here reported, of cancer, the greater omentum, liver, spleen, stomach, lumbar and iliac glands and adrenals, were all involved in the disease; it is probable that the primary disease was in the stomach, the other organs being affected by secondary infection. No history is given, but there is nothing in the necroscopy to suggest Addison's disease. And the recorded cases of cancer of the adrenals rarely, if ever, do give clinical symptoms such as are found in Addison's disease. The second case is reported only to show how very large a malignant growth of the glands may become; there is no history, but it is probable that the case was one of general cancer like the first. It is interesting to note that the kidneys were not affected by the disease in either case.

MISCELLANEOUS.

good guide to the performance of surgical operations. Thirteen cases of enteric fever occurred altogether among persons resident in the neighborhood—one in August opposite the affected dairy, the family of the sufferer receiving milk from this source. In another house five cases occurred among a household of seven. This household did not receive milk from the suspected dairy, but they used for fuel cowdung collected in the neighborhood—not from the affected calves, for these were tied up; but perhaps from other animals suffering from the same disease. In another family two cases occurred, and in this house cowdung was also used for fuel, the source from which it came being unknown. Another case occurred in the person of an infant at its mother's breast, but this child, the mother states, received no other milk than her own. Concerning the household, no distinct mention is made of the fuel used for burning. The remaining four cases were all in one house; milk was not received by this household from the suspected dairy knowingly at the time of the appearance of the first case, but during this child's illness this dairy supplied the milk for the rest of the family, but it was at this time regularly enteric fever. There is to be found in these cases "On Mental Responsibility in Inebriety." By nothing more than a suggestion that the bowel discharges from the animals in the dairy may have been concerned in the production of some of the cases of enteric fever in the neighborhood. Dr. Allen has omitted to state the total number of households using for fuel the material which he suspects has given rise to disease, and the whole facts are therefore not sufficiently before us to enable any positive opinion to be formed on the subject; but Dr. Allen's story is well worth bearing in mind in any further investigation into the etiology of this disease. In another report Dr. Allen insists upon the simultaneous appearance of enteric fever, among the inhabitants of the neighborhood of the farms. and the appearance of what he describes as specific MILK INFECTION: A SUGGESTION .- Dr. James F. enteritis among the calves. He states that he ex-Allen, medical officer to the Corporation of Picter- amined the mesentery and small intestines of one of maritzburg, has written a very suggestive report on these animals; that he found the mesenteric glands enlarged, and in the intestinal mucous membrane stetrical and Gynecological Society of St. Petersburg, evidence of the same diseased action as is to be found in that of human beings after death from the first number of which appeared on February 17, both diseases; and he asserts that the two disorders *Record*. in Pietermaritzburg at least are always found together.—*Lancet*. Nov. 20, 1886.

HEALTH IN MICHIGAN.—For the month of February, 1887, compared with the preceding month, the reports indicate that remittent fever decreased in prevalence. Compared with the preceding month. the temperature in the month of February, 1887, was higher. The absolute humidity, the relative humidity. the day ozone and the night ozone were more. Compared with the average for the month of February in the nine years, 1879-1887, intermittent fever, pneumonia, diphtheria, consumption of lungs, and influenza, were less prevalent in February, 1887.

less, and the night ozone was less.

others, diphtheria was reported present in Michigan. This, of course, has commended our medical science in the month of February, 1887, at thirty four places, to the people, and they come in numbers." scarlatina at forty-two places, typhoid fever at sixteen places, and measles at twenty-four places. Reports from all sources show diphtheria reported at twentytwo places less, scarlet fever at six places more, typhoid fever at two places more, and measles at three places more in February, than in the preceding month, January, 1887.

MICHIGAN STATE BOARD OF HEALTH.—At the 276th meeting of the Brooklyn Pathological Society, held at the Brooklyn Eye and Ear Hospital, February 24, 1887, the following resolutions was unanimously Major David L. Huntington, Asst. Surgeon, ordered for duty at adopted.

Whereas, the State Board of Health of Michigan, has been for many years a pioneer in the investigation of disease and the collection of vital statistics, Capt. Robert II. White, Asst. Surgeon, on being relieved by

THE PRACTICE OF MEDICINE AMONG THE GREEKS PRIOR TO THE AGE OF HIPPOCRATES: A CONTRIBUTION TO THE HISTORY OF MEDICINE.

> BY J. M. BALL, JR., M.D., OF WATERLOO, IOWA.

early inhabitants of Greece, called Pelasgi, were living gration of successive parties from Tyre and Memphis. and even the mouth of hell was said to be on the far-It is said that Inachus, the victim of a revolution, he founded the city of Argos, 1,856 years before the civilization of Asia and Africa was amply repaid by the Ionian migration.

most intellectual, and they were so, not through any inherent faculties in themselves, but simply from the force of circumstances. At a remote period in their history they were forced to leave their homes on the shores of the Corinthian gulf, and to seek a new abode. For a short time they took refuge in Attica, whose territory was found to be too small to support the increase of population. Accordingly, they resolved to seek new settlements in the East, and in their passage across the Ægean Sea they colonized most of that group of islands called Cyclides. On reaching Asia Minor, they took possession of that Meander, together with the islands Samos, Cos. Lesbos, Chios and others. This migration was of great subsequent importance. While their kinsmen in Attica were struggling for a bare subsistence, and were often hard pressed by the neighboring tribes, the Ionians, having settled in a fertile and luxurious country and among a race wealthier, but far inferior to themselves, soon found those means of ease and leisure which, to a certain extent, seem necessary to the development of intellectual culture.

It is the object of this article to describe the condition of medical practice among the ancient Greeks prior to the age of Hippocrates. The writings of Homer present us with a vivid picture of the state of

Europe a thousand years before the birth of Christ. A twilight was dawning on the most eastern verge. in the countries adjoining the Hellespont, but the West and the North were immersed in darkness. "In the intellectual infancy of a savage state, man transfers to nature his conceptions of himself, and, considering everything that he does is determined by his own pleasure, regards all passing events as depending on the arbitrary volition of a superior but invisible power."

The white race at that period was At a time when Egypt, Chaldea and Phœnicia were like a child. To the Greek, no fiction was too marenjoying the benefits of an advanced civilization, the vellous for belief, if it was separated from his view by a hundred years or a hundred miles; the exaggeraon the acorns of the forests, clothing themselves with tion of tradition confirming it in the one instance, the skins of wild beasts, and sleeping in caves. The and the difficulties of travel in the other. Every hill arts and sciences were carried to Greece by the emi- had its supernatural legend, every forest its phantom, ther side of the Euxine. The medical mythology of conducted the first Egyptian colony to Greece, where the Greeks is remarkably full, and the learned Le Clerc,2 with commendable zeal, has searched through common era. The indebtedness of Greece to the history, poetry and inscriptions, hoping to find something which would shed light upon the origin of our science. He details the names of more than thirty Of all the Greek peoples the Ionians were the gods and goddesses, heroes and heroines who possessed a knowledge of medicine.

> The first of the Greeks who immortalized himself by his wonderful cures was Melampus, to whom altars were erected by his grateful patients. He is said to have lived 200 years before the Trojan war. His most famous cures were performed upon the daughters of Proteus, King of Argos, who were afflicted with outbreaks of mania, during which they imagined themselves transformed into wild beasts and ran raging through the forests. The cure is said to have been effected by the administration of hellebore.3

Medicine was brought to Greece by the sage Chistrip of country lying between the rivers Hermes and ron. There is much mystery attached to his character and to everything connected with him, but what we may consider as the most probable conclusion is that he was a prince of Thessaly, who lived a short time previous to the siege of Troy, that he was far superior to his contemporaries in knowledge, and that, after the manner of his countrymen, he was so frequently seen on horseback as to give credence to the fabulous story of his being a centaur.4 He held his school in a grotto in Thessaly and, if the chronicle may be believed, no philosopher of antiquity, no

Sick pering nature, is said to have been the father of Æscu- sons repaired, or were conveyed to the temples of culapius.

this world was entirely in harmony with his divine deputy. The sick person or his representative, after character, and was of itself sufficient to show that he prayer, sacrifice and ablution, was made to sleep upon was no ordinary mortal. According to Ovid, he was the hide of the sacrificed animal, or at the feet of the cut out of the womb of his mother, Coronis, by statue of the god, while sacred rites were performed.

"Ut tamen ingratos in pectore fudit odores, Et dedit amplexus, injustaque justa peregit; Non tulit in cineres labi sua Phœbus eosdem Semina; sed natum flammis uteroque parentis Eripuit, geminique tulit Chironis in antrum." -Metamor., lib. ii, v. 626.

In infancy, Æsculapius was exposed upon a mountain in Thessaly, and was suckled by a goat and defended by a dog. A shepherd having for some time those at Epidaurus, and on the island of Cos, were missed his goat and dog, went to the mountain to particularly famous. The island of Cos, for centuseek them, and found the child possessed of extra-ries, remained the Mecca of medicine. None but ordinary beauty. He raised the boy with the greatest care and gave him into the hands of the sage, exclusion of all unholiness extended to all other tem-Chiron, by whose instructions he profited so well as ples. Only the priests could look upon the columns to far surpass his master in fame.

Marvellous stories are told of Melampus and Chience as many celebrities as the centaur saw in his ron. These, however, are insignificant when comcave. He instructed Jason, Theseus, Castor and pared with the feats of Æsculapins. In addition to many other astonishing powers, he was gifted with a pious Æneas, and the invincible Achilles: all heroes remarkable faculty, peculiar to himself, of raising at who distinguished themselves either at the capture of pleasure the dead to life. Not less than six or seven the fleece of gold or in the Trojan war. He taught instances are on record of distinguished corpses that Apollo music, Æsculapius medicine, and Hercules were benefited by the exertion of this happy talent. astronomy. He cured Phænix, son of Amyntor, of It is impossible to say how far the bounds of science a blindness supposed to be incurable, and obtained might have been enlarged by so mighty a genius had great fame in the treatment of ulcers. He was shot not Pluto taken alarm at his progress, and presented in the knee by a poisoned arrow and prayed Jupiter a memorial to Jupiter, humbly showing that if a stop to take away his life. The god heard his prayer and were not put to the career of this officious mortal, translated him to the heavens, where he is said to people would soon cease to die and hell would become a desert; whereupon Jupiter killed Æsculapius It is to Æsculapius, the pupil of Chiron that, by with a thunderbolt. It is probably for this reason common consent of antiquity, is ascribed the merit that the modern children of Æsculapius abstain from

We find Æsculapius first mentioned in the Homlapius, the god-like teacher of medicine. The same 'Æsculapius, in order to be cured, just as in modern tradition makes Circe to have been the sister of Æs. times relief is sought by a devotional pilgrimage, or from the waters of some sacred spring. Then, as The manner in which Æsculapius was ushered into now, the healing influence was sometimes sought by Apollo after he had destroyed her for infidelity. In his sleep the appropriate remedy was indicated by Apollo received the information respecting the un- a dream. The record of the case was inscribed on faithfulness of Coronis from a raven, and the angry the columns or walls of the temple. Æsculapius obgod is said by Apollodorus to have changed the color tained in antiquity a veneration which was almost of the raven from white to black, as a punishment universal, and his worship, which passed from the for his unwelcome officiousness. The story of the Greeks to the Romans, extended to all countries subunnatural manner of birth is thus related by Ovid: jugated by the two nations. Fifty years after the destruction of the kingdom of Priam, there was erected at Titanus, a city of Peloponnesus, the first temple in his honor. This edifice was reared by the grandson of zEsculapius, Alexanor, the son of Machaon. worship of this god spread with great rapidity.

The noted asclepia were very numerous, and in the work of Schulz more than sixty of them are described.⁷ Among the many temples consecrated to this god, the initiated could enter these holy shrines, and the of Hygeia at Ægeum; no dog was permitted to enter

are all fictitious beings whose symbolical names remind us of some attribute in medicine. Thus the name of Epion, his wife, means to quiet; those of negligence. A passage in Xenophon also proves Hygeia and Panacea, his daughters, express respect-that the young men, before establishing themselves ively health and a remedy for all diseases. Many of on the territory of the republic of Athens, were the gods and goddesses of Olympus fulfilled medical obliged to ask permission, in a public discourse, in

cause they condemned, and regarded as a crime divided the medical world. The priests in the temworthy of great punishment, all conduct towards the ple of Cnidus professed to depend on experience dead which was contrary to public prejudices. These alone in the treatment of disease. They argued that prejudices had their origin in the belief that the soul, if reason taught differently from experience, it was when freed from its earthly covering, was forced to injurious, but if it taught the same it was unneceswander on the banks of the Styx until the body was sary. Thus the very source of medical teaching was buried or cremated. Hence the celerity with which contaminated with the germs of sects and systems. sepulture was performed on the dead to insure the to be burned:

" Next, O, ye chiefs! we ask a truce to burn Our slaughtered heroes, and their bones inurn: That done, once more the fate of war be tried, And whose the conquest, mighty Jove decide."

Scanty and imperfect as is our knowledge of the state of medicine in the age of Æsculapius, after his death and that of his sons, we have a long period extending over several centuries, during which we have still less it formation respecting the history and progress of the art. We have not a single improvement of any kind recorded as having taken place during this interval, nor have we the names of any individuals handed down to us who were of sufficient eminence to be distinguished above their contempo raries. We learn that the practice of medicine was entirely in the hands of the Asclepiadae, and that the temples were gradually converted into schools of medicine, among the most celebrated of which were those at Cos, Chidns and Rhodes.

The priests connected with the two rival establishments at Cos and Cnidus devoted their attention, from the outset, to different objects; those of the former asclepion assumed more of a philosophical caste, attempting to unite reasoning with experience, while the latter devoted themselves solely to the observation and collection of mere matters of in wisdom and judgment. The people of antiquity fact. Hence it would appear that thus early in the history of our art a foundation was laid for the two great sects, the Dogmatists and Empiries, which long

The mythological heroes whose labors were so Socrates alone defended them, but his eloquence was much boasted such as a Perseus and a Bellerophon, in vain when pitted against the deep-rooted preju-were succeeded by those great men whose names dices of the people.¹⁷ Even during the Trojan war have been justly celebrated in history, as Leonidas, it was customary to declare a truce to allow the dead. Miltiades, and Themistocles. Long before the Asclepiadæ revealed their knowledge of medicine, and previous to the dispersion of the philosophers, the art of healing was extensively practiced in the gymnasia. Of the physicians connected with these establishments, there were three orders: the gymnasiarchs, who regulated the diet of the athletes; the gymnasts, to whom was intrusted the medical treatment of the sick; and the jalaptres, whose duties were mainly surgical.

The revolt of the Pythagorians at Crotona was an event of great importance in the history of medicine, for it was followed by the disruption of the sect and indirectly contributed to the advancement of our science. When the storm of persecution had driven the philosophers into different parts of Greece, many of the members being no longer under an obligation of secrecy, revealed the workings of the order, taught publicly the art of healing, and thus originated the general practice of medicine. About 440 B. C. Metrodorus, a former member of the Pythagoreans, exposed their secrets, and set himself up as a teacher of medicine. About the same time the practice originated among physicians of migrating from place to place and of making a public declaration of their skill. The same custom prevails to-day among us, who are supposed to far exceed the ancient Greeks called these itinerant physicians periodevtæ, while the moderns name them charlatans.

When the disciples of Pythagoras had revealed the secret of their mysteries, and the philosophers 26 Sprengel: Geschichte der Arzneikunde, Erster Theil, p. 141, had dared to teach and discuss publicly the principles of morals, physics and theology; when the itin-

of Medicine, was descended.

THE THERAPEUTIC VALUE OF OXYGEN. With Reports of Cases Treated. BY SAMUEL S. WALLIAN, A.M., M.D.,

OF NEW YORK.

Regarding the availability and applicability of factitious oxygen as a therapeutic agent, there has prevailed, and still prevails, a very general professional misconception. This stereotyped estimate is based on the reports of early investigators, particularly those of Lavoisier, who asserted that his birds, dogs, rabbits and guinea-pigs, when immersed for a short time in an apartment or receiver filled with crude oxygen gas (derived from and doubtless tainted by the bungling decomposition of an oxide of mercury,) became excited and preternaturally lively, which condition was followed by more or less physiological depression. Considering the crude state of chem-

erant physicians and professors of the gymnasia had ical science at the time, and the questionable proacquired the confidence of the public, the priests of cesses employed, it is easy to understand that these Æsculapius could no longer keep silence, under the results were not necessarily attributable to the newly penalty of seeing the sceptre of medicine, which they discovered gas, the nature of which was being had held till then, depart from their hands. They eagerly and none too honestly investigated. These were forced to bring to the light of discussion the hasty and superficial impressions seem to have been principles and rules of their medical practice. It accepted without question and without satisfactory was in this manner that our science came forth at verification; and, what is more surprising, they have ever since remained as accepted dogmas in the The priests who served in the temple of Cnidus world of physiological chemistry. In the century were the first to follow the impulse of the age, and that has since elapsed chemistry and physiology have they issued a small repertory of medical facts called both been revolutionized; but with all the progress the "Cnidian Sentences." These are said to have made in this direction few text book authorities have been written by Euryphon, a contemporary of Hip-thought it worth while to investigate from a fresh pocrates. The Asclepiadae of Cos were not slow to standpoint, or to disturb the fossiliterous strata of follow their example, and they published a series of scientific thought handed down from the latter end

It is now known that the decut down the groves and of the timber made his carbonization of the blood is not the principal office ships. Such was the fate of those noted temples of of the oxygen derived from atmospheric inspiration. medicine. Although long since destroyed, they have The experiments of Magnus show that from ten to left an influence upon our art which will last as long twenty five per cent. of the oxygen inspired by a as time itself. It was from this family of priest-physi- human adult is absorbed directly and in a free state. cians, the Asclepiadae, that Hippocrates, the Father into the blood. The affinity of blood, arterial as well as venous, for oxygen is shown to be very great. Compared with that of water the ratio is as 21/2 to 1. This is doubtless the key note to the action of oxygen, therapeutically exhibited.

Dalton has shown that the carbon dioxide constantly exhaled by all animal bodies is not all formed by contact of the circulating fluid with the oxygen of the air. It already exists in venous blood before it reaches the lungs. Hence, it is constantly being formed in the tissues themselves, as well as in arterial blood; since the same authority shows that both carbon dioxide and free oxygen exist in arterial blood. According to Magnus there is a nearly constant relation between them, the mean proportion being, by volnme, as 10 to 25 in arterial, and as 10 to 40 in venous blood. If these premises be accepted, and no one has as yet disputed them, carbon dioxide is not, as generally taught, wholly the product of respiration. No doubt a small portion of that expired is formed at the moment of contact of atmospheric oxygen with the carbon-loaded blood as it reaches the aircell, but more of it already exists in the circulating fluid. The venous system is thus seen to be a colthe various processes of reconstruction.

A REMARKABLE RESULT FROM AN OPERATION FOR STRANGULATED HERNIA.

Read before the Wayne County (Indiana) Medical Society. BY S. S. BOVD, M.D.,

OF DUBLIN, IND.

On May 17, 1886, I was called to see John Leeson, aged 52 years, who was suffering from direct tumor below the ring was about five inches long and sickness and vomiting, being absent, and as I had, Case 23.—P. E., age 22. Subject to periodic two months before, reduced a similar strangulation in headache of so severe a type as to have injured his the same patient, of four days' standing, by taxis after anæsthetizing with ether, I thought it safe in oxysms are generally a true migraine and of fairly this case to make an effort at reduction by the same explosive violence. They recur from once to three means. Being assisted by Dr. H. B. Boyd, we had times per week quite regularly. Placed this patient the patient placed on a broad board, which was inclined at an angle of about thirty degrees from the horizontal, with his head downwards, his head and shoulders being supported by pillows, I resorted to the usual manipulations. After pursuing this course three and a half hours we abandoned the effort in that direction.

Dr. C. N. Blount was then called in consultation, oxysms, and in four weeks patient assures me he is when we concluded, as the symptoms were still not urgent, to try the topical application of ice. During the next eight hours blocks of ice of about a lb. Case 24.—Miss W. M., age 24, teacher. Has weight were continuously applied over the tumor, "consumption." The family history is not favorable. or other unfavorable symptoms. The pulse, which October 20.—Not being able to come to the had not been over 80 per minute, was not increased,

On the morning of May 20, the fifth day after the opened it was found to contain omentum only. The Case 25.—Mrs W. A., age 62. Has been for distal end of the contained omentum was dark, but ble, then incised the omentum as near the ligatures that I was mistaken in my former diagnosis, as the as practicable, and after enlarging the stricture, we child was not cyanosed, the skin having regained its returned the stump into the abdomen. After placing normal color. I treated the case for bronchitis. three deep sutures in the wound, the usual dressing completed the operation. The removed omentum ago, when I was called on to make a post mortem exweighed nine ounces. It was about four inches long amination, the child having died from the effect of and one and one half inches thick, and nearly round, disease at the end of the sixteenth month. being a little larger at the proximal end.

patient passed per anum one of the ligatures used in dition, and as to the manner in which the circulation ligating the protruding omentum above mentioned, was carried on so as to sustain the life of the child and at the same time there was found in the stool of for sixteen months. I would also like to hear of any the patient a piece of what was supposed to be a similar cases, if there be any on record. part of the omentum devoid of its fatty substance. The pulse and the temperature again rose to 100, but fell back to normal the next day. Three days later another one of the four ligatures used in the operation was found in one of the patient's stools.

At no time during the treatment of the case did the patient suffer much pain; and there was but little swelling of abdomen. Opium was freely used from the time of the operation until the patient was considered out of danger. It is now nearly nine months since the operation, and the patient is well and pursuing his occupation as a farmer.

MEDICAL PROGRESS.

TREATMENT OF HERNIA BY SUBCUTANEOUS IN-JECTION.—At the meeting of the New York County Medical Society on December 27, Dr. W. B. DE GARMO gave a brief history of the treatment of hernia by methods purporting to be subcutaneous, the object of all of which had been, up to the time of the publications of Heaton's method, to cause obliteration of the hernial sac. Heaton had been practicing his method, and obtaining many cures, since 1843, but he refused to make it known until 1877. Heaton made no attempt to destroy the hernial sac; the whole object of his operation was to so fortify 1 wish briefly to record a case of cardiac anomaly the fibrous tissue surrounding the canal that protruwhich is altogether different from any case that I sion would not occur. His method stood alone; it have ever seen, and so far as I can find there is no differed in every way from previous methods of subcutaneous treatment; the fluid injected was astrin-I was called to see the child when one week old, gent and mildly irritant, and its action was brought I found it fairly well developed, weighing eight or to bear upon the muscular and tendinous structures nine pounds, with more or less incomplete, though of which the inguinal canal was composed, and upon marked, cyanosis. Breathing was labored, and there the connective tissue which bound these layers towas a slight cough. I made a diagnosis of non- gether. That improvement and practically cures closure of the foramen ovale, and gave an unfavoral would result from injections of this oak-hark solution the reader had had abundant evidence, and he could I was superseded by a physician of considerable also state that it was practically without danger, at reputation, who pronounced my diagnosis incorrect. least when correctly employed. and essential element in epilepsy; it is the single epilepsy is to be found in the sensory, rather than the truly sudden disease, the only affections resembling it motor, centres, he has grown much less skeptical of in this particular being laryngismus stridulus and the advantages of treatment in this disease than formspasmodic asthma, though in these the suddenness is erly. The first thing to be aimed at is the improvefound not to be absolute as in epilepsy. Apoplexy, ment of nerve-nutrition; and by far the best agent for hemiplegia, sunstroke, etc., being accidents, cannot this purpose is cod liver oil, which he prescribes as be strictly compared with epilepsy: nor are hyster regularly in epilepsy as in phthisis. Phosphorus is also ical and neuralgic attacks so sudden as those of epi- a useful remedy in this connection. Like the great lepsy. Furthermore, Dr. Thomson regards petit mal mass of physicians, he has found the bromides the as the most real form of the disease. In regard to best agents for controlling peripheric irritation, and the cell discharge or explosion theory, the views of he has found cod-liver oil of very good service in Hughlings-Jackson, and Nothnagel's "convulsive cen- counteracting their debilitating effects. When there tre," he thinks that if no other form of epilepsythan is persistent cortical irritation, as indicated by muscontrol of sensory impulse, and a sudden suspension. Digitalis he uses in all cases characterized by vas-

of the regulating sensory impression may result from a variety of causes. Any irregular motor phenomena are therefore due to a loss of the customary sensory influence; and this, he thinks, explains the clinical facts of epilepsy without the necessity of supposing any additional nervous force being called into action.

He considers the phenomena of epilepsy to be the munications in regard to editorial work should be addressed to the Editor, effect of an afferent sensory impression when some abnormal condition of the nerve centres is present. What this condition may be he is not prepared to say, but it seems most probable to him that it is one of malnutrition. If asked if he would assert that all cases of epilepsy are attended with sensory impressions in the face of the well known fact that in certain instances there are definite lesions of the brain present, he would reply that we do not get rid of the sensory element when we enter the cranial cavity. A syphilitic gumma of the brain may be as truly an excitant of sensory irritability as an external impression. He does not hesitate to acknowledge that a motor centre may be excited by the application of At a recent meeting of the New York Academy an electric current after trephining the skull; but the

a considerable quantity of blood was flowing. The probe showed that the parenchyma of the organ was THE TREATMENT OF WOUNDS OF THE LIVER. penetrated, below and to the right, to the depth of Traumatic lesions of the liver have but a small 5 or 6 ctm. The state of the patient was now such cape, and after nine weeks there was only a small

fistulous tract, caused by a piece of gauze which had delivered dead woman centuries before it was resortbeen forgotten; when this was removed recovery ed to on the living. So far as he could ascertain, the was soon complete.

Burckhardt calls attention to the value of tampons of iodoform gauze as an excellent means for arresting hæmorrhage, and, in such cases, of preventing the escape of bile into the peritoneal cavity. In spite of the friable nature of the liver sutures are perfectly practicable, as experiments on animals have shown; but they are seriously inconvenient. An incised wound of the hepatic parenchyma must involve some of the bile-ducts, and it is unlikely that these could be sutured with convenience or success; and to simply suture the liver tissue about them would result in escape of bile into the peritoneal eavity. But a piece of iodoform gauze placed in the wound will arrest both hamorrhage and escape of bile.

AMERICAN MEDICAL ASSOCIATION.—We invite the attention of our readers to the official notice of the next meeting of the American Medical Association in another column of this number of THE JOURNAL. The general sessions will be held in Central Music Hall, most conveniently located and admirably adapted for the purpose. There are gratifying indications of renewed interest in the Association in the most widely separated parts of the country. Let full delegations come from the East, the South, the West and the North; Chicago has room for all, and will give to all a cordial welcome.

SOCIETY PROCEEDINGS.

MEDICAL SOCIETY OF THE DISTRICT OF COLUMBIA.

Stated Meeting, January 26, 1887. THE PRESIDENT, Jos. TABER JOHNSON, M.D., IN THE CHAIR.

H. M. Curts, M.D., Secretary.

The discussion on Dr. Jos. Taber Jourson's paper on

C.ESAREAN SECTION

(see pages 189 and 270), was continued.

Dr. J. F. HARTIGAN said that although he had listened attentively throughout this discussion, nothing had been said to change his first impressions as to the proper procedure to adopt when confronted with

first published histories of this operation on the living female-400 years ago-are just as misguiding as recent statistics; for the reason that only those have been reported that showed the most success, and we are left in the dark as to the numerous failures. In other words, more than 75 per cent. of the cases published have perished; while if the same pains were taken to bring to notice all the unfortunate cases, the supporters of this most formidable operation might be reduced to a minimum. The discussion of this subject has been going on elsewhere lately, and much of it seems to have been inspired by certain religious sentiment. But this is not a body of religionists. We meet to discuss medical subjects on a purely scientific basis, and to stand by those who place their lives in our hands, and trust us with them. He asked if it was right that a valuable life should be placed in further jeopardy in order to attempt to save one that has at most but a precarious existence. We will suppose that the operation is performed, and the child survives; it has only even chances of living up to the fifth year, and would such survival fill up the void left by the death of its mother? No, sir; our first and sacred duty is to the patient. In that terrible hour of trial we all have heard the cry, "Whatever you do, Doctor, save my wife!" Is there a man in this room who would turn a deaf ear to such an appeal, or who would any longer hesitate as to where his duty laid? He said he was no craniotomist, but the teachings of ages, as well as the dictates of conscience and humanity, compel us to treat our patients as we would treat ourselves, and to save that life which is of the most value.

My position on this question is best expressed in the following extract from Cazeaux and Tarnier, just published: "This operation may be practiced on the living female whenever the natural passages through which the child has to pass are so narrow, or so obstructed, that a delivery by the application of the forceps, or by symphysiotomy, is wholly impossible; and when the mutilation of the child itself would not permit its extraction without exposing the mother to the greatest dangers. It may likewise beresorted to for the purpose of saving the infant when the patient dies in the advanced stages of gestation."

Dr. G. Wythe Cook said that although we consider lives of equal value, still if confronted with the problem of an unborn child, the sacrifice of whose life was necessary in order to save that of the mother, there could be no doubt in his mind as to the choice. If more lives can be saved by the Casarean section than by embryotomy, then Cæsarean section is the operation to be done, for it is a serious thing to take the life of an unborn child, or even to teach that it may be done. Successes in Germany indicate that much may be hoped for in the direction of Casarean section, though the statistics of England and this country are not so encouraging.

He said that he spoke feelingly upon the subject, such a calamitous situation. The C.esarean opera- as some twelve or more years ago he was so unfortion is so ancient that its origin can hardly be traced. Itmate as to be called to a case in the country in the 'Tis enough to say that it was performed on the un- care of a midwife, in which the arm had been protruding for twelve hours; the shoulder was impacted, gical, or obstetrical science and human detormity, it but the child was still alive. Those who would wantenly kill a tion in the United States, of which I had full data; child; those who speculate in human life; those who and, knowing the feeling upon the subject, I entitled "kill at will," are the ones he would condemn. The it "Can the Cæsarean Section Supplant Craniotomy term "murderer" is a rather harsh one to apply to in the United States at the Present Day?" To this men who are acting as conscientiously as those who the answer was, No. Now, while I endorse all that do the Casarean section. Who does the "killing" has been said in favor of Casarean section, my con- when Casarean section is done when delivery is imscience would not permit me to agree that craniot- possible except by craniotomy, and both mother and omy should be entirely abolished. In my opinion, child die? Might not the broad-minded physician there is no comparison between the value of the life have saved the mother? The question is submitted of the feetus and its mother, and our duty is to her to the husband, and we hear the cry, as Dr. Hartigan first. Save them both if we can. Dr. Thompson says, "For God's sake save my wife!" There is no says that the Casarean section is a "cleaner and love for the unborn child under the circumstances, more perfect surgical procedure"--these words oc- while the husband does love his wife and would opcurred in my paper, so there again there is agreement. pose the risking of her life. Who of the audience The statistics quoted in my paper were not made by would submit his wife to the "increased risk" favored me, but by the surgeons of the United States who by one speaker? Where do we go for our authority performed the operations. These showed that of in these matters? and if we had a suit at law, to whom nincteen Cæsarean sections done in the United States or what should we refer? To the text-books-and during the past ten years, seventeen of the women there is not a text book published to-day that does had perished and fourteen of the children were still- not tell how and when to perform craniotomy. If we born, and that of the five Sänger operations per- were to pass a resolution to-night, declaring that the formed within the last five years all of the mothers doctors of the District should never do craniotomy, died. That is not a brilliant showing for our opera- and should adhere to it, the people would not have tors, especially when compared with the results ob- us in their houses, because they would consider us men who did not know our duty to humanity; or if

Prof. C. Braun, who has successfully performed could be "killed at will." Until there is a better several Casarean sections, and the Porro operation average than 90 per cent. mortality for C.esarean three times, states, on p. 691 (Lehrbuch der Gynäksection in our country, no one ought to be blamed ologie) when the operation should not be, as well as for holding on to craniotomy a little longer. To use when it may be done. He says: "This operation Dr. Busey's own way of arguing, let us compare the is not permissible when the parturient woman, in full last nineteen Clesarean sections in the United States consciousness and without indirect coercion, declines with nineteen imaginary craniotomies. In the former, the Casarean section. Further on he says: "It is with the possibility of saving thirty-eight lives, only not right to subject her to this operation without her seven were preserved; while in the latter, although consent, when she has been rendered unconscious by we start with only a possible nineteen, the number of disease, anæsthetics, poisons or intoxicating drinks." saved would not probably be as low as seven. Har- In this Braun differs somewhat with Drs. Busey and ris says of this mortality in the United States that "it McArdle, and agrees with me that craniotomy should makes him sick at heart to think of it;" and Parrish sometimes be done. Dr. Busev says that craniotomy says "it is a terrible mortality, and should make is inadmissible in the justo-minor pelvis, and quotes

ter of fact, they only condemn it in what we call the PH LADELPHIA COUNTY MEDICAL SOCIETY, higher grades of the deformity. As against this assertion Merkel reports, out of 100 craniotomies, thirty-seven in the generally contracted pelvis with only two deaths. Also we find that C. Braun, Speth, Schroeder, Créde, Spiegelberg, Charpentier and Barnes The President, J. Solis Cohen, M.D., in the explicitly advise the performance of craniotomy in the lower grades of the generally contracted pelvis. I would add to these Cazeaux and Playfair, and refer to the views of Parvin as quoted in my paper. Dr. Busey quoted four men as taking ground against craniotomy. Of these Lusk (p. 482), says that, under certain conditions, "delivery of the child with- large cystic ovarian tumor was considered the only out perforation is often impossible," and I personally indication for abdominal section, and, if other conlition of craniotomy. Dr. Busey has discussed the simply quietly closed. The dangers of the operation question from the proper standpoint of its scientific itself were so great that surgeons were loath to ingan and Cook have also viewed it from the same as tience to discuss the peculiar points made by him, nineteen separate morbid conditions.

The public and the profession are not yet ready for the abolition of craniotomy, and even most of the removal of ovaries and tubes not to the naked those who talk against it admit that there are cases eye diseased, we are most often compelled to operin which it gives the best, and perhaps the only ate for pain. The patients themselves, seeing nothchance to the mother. When there is a doubt in a ing amiss, are very loath to submit to "being case as to which operation is the most expedient, one opened" until their misery makes life a burden—at always wants advice and counsel. What is the use least this has been my own experience with women, of sending for a man who will not judge by the sympeto whom I always explain, in the fullest possible toms in the case, but who is bound by a cast iron rule manner, the exact nature of what I propose to do, never under any circumstances to perform craniot- and its consequences. It is gratifying to the operaomy, whose opinion you know is adverse? You are tor, who has finally been driven to this expedient, to aware that it cannot be changed by evidence or find gross lesions suitable for class demonstrations, reason, and are thus debarred from sending for him. but the most typical relief often comes where the In the case reported by Dr. Cook a living child was disease cannot be so easily demonstrated; and in allowed to die by delay and then delivered by embryotomy. Its mother died also as a result of this ing infiltration and cellulitic inflammation are often accordance with Dr. Cook's wishes, and with proper arrangements, the woman would probably have been saved. Dr. McArdle makes it appear that Polk teaches that craniotomy should be abolished. Polk only says that he hopes it will be abolished in two years; and I unite with him and all those who would utterly abolish craniotomy in hopes that medical science may, sooner than that even, arrive at such a state of perfection as to render "sacrificial midwifery" unnecessary: but at present, as argued in my paper, hands with the half dozen who agree with Drs. Busey and McArdle, and work with them to that end—but abolition of craniotomy is an aspiration, not an ac- as if a great weight had been lifted off her, and went complished fact."

Stated Meeting, Tebruary 9, 1887. (Concluded from page 278.)

CHAIR.

DR. H. A. KELLY presented the

RESULTS OF SOME GENERAL WORK IN ADDOMINAL SURGERY WITH CASES AND SPECIMENS.

Many here to-night remember the time when the know that Mr. Tait does not believe in the total abo. ditions were accidently discovered, the incision was aspects, and left out personalities, which is difficult terfere until the wretched condition seemed to warto do in such discussions. For my part, I desire to rant the risk. As, however, our race cultivated a discuss it in the same spirit. Drs. Bromwell, Harti- familiarity with the peritoneal sac, and learned its limits of toleration and intolerance, a bolder and pect. The latest speaker says, however, that "no more successful work was entered upon. With man is able to say which life is of most value." Per. dropped pedicles, innumerable ligatures for hæmorhaps if the mother were a relative of ours there would rhage, peritoneal toilet, drainage tube, and above all, be no difficulty in making up our minds. But Dr. an unremitting care to secure microscopic cleanliness McArdle, at the last meeting, was not quite so im- throughout, we have become masters of the situapersonal. In his written remarks, he quoted largely tion, and our failures, when they occur, are no longer from my paper. Dr. McArdle was the first in this mysteries. And with these improvements has come city to suggest the total abolition of craniotomy, and a recognition of greater variety of indications for therefore deserves the title of reformer. I cannot abdominal section, until, as to night, I am able to endorse his position, and have not the time and pa- present, out of twenty eight successive cases, at least

In the removal of small tumors in the pelvis, in cases where there are palpable tumors, the surroundpolicy. If embryotomy had been done sooner, in serious enough to delay convalescence, for a long time defeating the operator. Thus, if I were asked, in my own work, which of my cases had given the most gratification—that is, where had the relief been most typical and striking from a condition of suffering—1 would point out a patient who was for more than two years unable to take a step on account of the great pain in the right ovarian region; in addition, she was a most wretched sufferer throughout the whole time. There were no gross lesions in the ovaries, and it was long a question with me whether I cannot favor its complete abolition. I would join she had not some other serious organic disease, which question I debated under the most varied and patient efforts at general and local treatment, until, I believe now with Barnes, "that as yet the total with the removal of ovaries here shown, she rose up home to her parents and friends, a walking miracle. Mrs. W. She suffered ever since her first menstrua for their blood supply, and when they are torn loose, tion, from pains which left her a most degraded the bleeding is alarming; and it may be deep down picture of misery when she came to my office. present.

cases, however, which will tempt most of us to operate. Dr. Kelly's case of simple chronic salpingitis in which he had such happy results is a case in point. A case operated on by myself was just such a one and terminated just as happily.

Dr. J. Price said: In Dr. Kelley's cases it is as yet too early to speak positively with reference to hernia, but his incisions have been short. In the December number of the Lancet, Mr. Tait gives a review of this whole subject and of hæmatocele. wish to argue against the removal of the appendages for defective involution. We have many other methods of treatment which will surely accomplish the same result without resorting to such bold measures. I consider this an unjustifiable procedure.

At present, the surgeon simply presents numbers and percentages of recoveries as representing the exact measure of his skill in operating and care in the Too great importance has been after-treatment. given to bare statistics. The conditions inherent in the patient which determine the result beyond the control of the surgeon are barely considered, nor faults of omission or commission on his part. Perfect evacuation of pus, the utmost cleanliness, and proper tension is applied by two rubber bands. perfect drainage—I mean a high degree of surgical cleanliness.

The growing tendency to hold the surgeon strictly responsible for every unfavorable result has stimulated abdominal operators to great care, and the most careful study of every detail. Hence, the methods of abdominal surgery have become wellnigh perfect.

Dr. Kelly said: I have had no practical experience in the treatment advocated by Dr. Hewson; if it can be shown to be practicable in such cases as I have detailed this evening, I will try it. My efforts, however, have been directed toward the establishment of a cure, and not palliation. With reference to the case of enlarged painful uterus, with endometritis, of which Dr. Price has spoken, I desire to

> Dr. H. Augustus Wilson presented and described:

> A NEW APPARATUS FOR PREPARING DRY GYPSUM BANDAGES.

> Rolling the dry plaster of Paris bandages by hand, the method usually in use, is unsatisfactory, and under the most favorable circumstances a dirty process. It was to avoid the inconveniences and irregularities of that method that I devised this apparatus, which I have had made by A. G. Gefvert, orthopædic apparatus manufacturer.

> It consists of an ordinary box-bandage roller, with addition of the following: A movable bottom, A, A, A, held in contact with the outermost layer of the bandage as it is rolled, by a rubber band B, and the other end by a hinge-joint C. Upon this movable bottom, and just in front of the crank, is a tlood-gate or distributor, not shown in the illustration, which equalizes the distribution of the plaster and presses it into the bandage from above, while the movable bottom prevents the gypsum from passing through the meshes. The

The Governor has at last given his official approval of the order made some nine months ago by Mayor Grace removing General Shaler from the office of President of the City Board of Health. P. B. P.

SAENGER'S CÆSAREAN OPERATION.

Dear Sir:—In his excellent paper entitled "Can the Cæsarean Section be Safely Substituted for Craniotomy in the United States at the Present Time," published in The Journal of February 12, 1887, and in the scientific conclusions of which I fully concur, my friend, Dr. J. Taber Johnson, in one place mentions me in a way that may give rise to misunderstanding, if not corrected. He says: "To quote" from recent authority, in the October number of the American Journal of Obstetrics, page 1021, by Gar rigues, who claims that the Sänger method should as properly be called by his name as by Sänger's, and further, that there is really nothing in this 'method' after all, as the most successful operators get on bet ter without it—Garrigues says," etc. To those who have not read my paper, or who have forgotten the particulars of it, the first assertion looks as if I had laid claim to the so-called Sänger method, but a reference to the passage alluded to in my paper will "When he (Sänger) says that American physicians might as well call the improved Cæsarean section mine as his, I quite agree with him, but I make haste cauterization of the nasal mucous membrane will cure to add that one thing would be as ridiculous as the the majority of the cases of asthma." This statement other. The improved Cæsarean section is a beauti- is controverted by my objection to Dr. Ingals' secful outgrowth of general surgical and special gyne- ond point. cological development, an evolution due to the combined efforts of many men working independently in different countries.'

The second assertion put into my mouth, viz., that there is really nothing in this "method," after all, will be very apt to be misunderstood. The cause of this that the words, "Sänger's method," have a double meaning. I show, in the paper referred to, that the only original idea of Singer was the resection of the two slices of muscular tissue of the uterus contiguous to the incision made in that organ, but unfortunately, not only German, but English, French and American writers have got into the habit of call- from permanently organized State Medical Societies, ing the whole improved Cæsarean section, with its manifold steps due to different men, by Sänger's; name. In the above-mentioned quotation from Dr. J. T. Johnson, it must be well understood that in the first sentence he refers to the whole improved Cæsa- vice of the United States. rean section, while in the second he has only in view that part of Sänger's so-called method which really etyentitled to representation shall have the privilege belongs to him, namely, the resection of muscular of sending to the Association one delegate for every

Very truly yours,

H. J. Garrigues, M.D.

155 Lexington Ave., New York, March 10, 1887.

"THE ETIOLOGY AND CURE OF ASTHMA."

Dear Sir:—In the issue of The Journal for Feb. 26 appeared a short review, under the above heading, by Dr. E. F. Ingals, which is likely to mislead those not familiar with the subject. I was astounded at the manner in which Dr. Ingals perverts the meaning of my words. Firstly, he claims priority for Dr. Wm. H. Daly against Flack. As the paper of Dr. Daly, quoted by Dr. Ingals, deals exclusively with hay asthma, and as my paper and quotations from Hack entirely exclude the consideration of hay asthma, there can be no discussion as to priority.

If Dr. Ingals is still confused on this point, I should earnestly advise him to read Hack's writings before

discussing them.
